```

- We study a combinatorial algorithm by which queues act on words.
- Fix a positive integer n.

- We study a combinatorial algorithm by which queues act on words.
- Fix a positive integer n.
- For a nonnegative integer k, let [k] be the set $\{1, 2, ..., k\}$.

- We study a combinatorial algorithm by which queues act on words.
- Fix a positive integer n.
- For a nonnegative integer k, let [k] be the set $\{1, 2, \ldots, k\}$.
- We shall refer to the elements $1, 2, ..., n \in \mathbb{Z}/n\mathbb{Z}$ as sites. Regard them as points on a line that "wraps around" cyclically:

```
\cdots n-1 n 1 2 \cdots n-1 n 1 2 \cdots
```

- We study a combinatorial algorithm by which queues act on words.
- Fix a positive integer n.
- For a nonnegative integer k, let [k] be the set $\{1, 2, \ldots, k\}$.
- We shall refer to the elements $1, 2, ..., n \in \mathbb{Z}/n\mathbb{Z}$ as sites. Regard them as points on a line that "wraps around" cyclically:

$$\cdots$$
 $n-1$ n 1 2 \cdots $n-1$ n 1 2 \cdots

• A *word* means a map {sites} \rightarrow {positive integers}. If u is a word and i is a site, then $u_i := u(i)$.

- We study a combinatorial algorithm by which queues act on words.
- Fix a positive integer n.
- For a nonnegative integer k, let [k] be the set $\{1, 2, \dots, k\}$.
- We shall refer to the elements $1, 2, ..., n \in \mathbb{Z}/n\mathbb{Z}$ as sites. Regard them as points on a line that "wraps around" cyclically:

$$\cdots$$
 $n-1$ n 1 2 \cdots $n-1$ n 1 2 \cdots

- A word means a map {sites} \rightarrow {positive integers}. If u is a word and i is a site, then $u_i := u(i)$.
- Write $u_1u_2\cdots u_n$ for a word u ("one-line notation").

- We study a combinatorial algorithm by which queues act on words.
- Fix a positive integer *n*.
- For a nonnegative integer k, let [k] be the set $\{1, 2, \ldots, k\}$.
- We shall refer to the elements $1, 2, ..., n \in \mathbb{Z}/n\mathbb{Z}$ as sites. Regard them as points on a line that "wraps around" cyclically:

$$\cdots$$
 $n-1$ n 1 2 \cdots $n-1$ n 1 2 \cdots

- A *word* means a map {sites} \rightarrow {positive integers}. If u is a word and i is a site, then $u_i := u(i)$.
- Write $u_1u_2\cdots u_n$ for a word u ("one-line notation"). Example: The word 33122 (for n=5) is the map

$$i = \cdots 4 5 1 2 3 4 5 1 2 \cdots$$

 $\mapsto u_i = \cdots 2 2 3 3 1 2 2 3 3 \cdots$

• A *queue* means a set of sites.

- A *queue* means a set of sites.
- Draw a queue q by putting circles on all the sites $i \in q$.

- A queue means a set of sites.
- Draw a queue q by putting circles on all the sites $i \in q$. Example: The queue $\{2,5\}$ (for n=7) is represented by

 \cdots 6 7 1 (2) 3 4 (5) 6 7 1 (2) \cdots

- A *queue* means a set of sites.
- Draw a queue q by putting circles on all the sites $i \in q$. Example: The queue $\{2,5\}$ (for n=7) is represented by
 - \cdots 6 7 1 2 3 4 5 6 7 1 2 \cdots

 We shall omit all the grey parts in the future (i.e., we will draw only one copy of each site).

- A queue means a set of sites.
- Draw a queue q by putting circles on all the sites $i \in q$. Example: The queue $\{2,5\}$ (for n=7) is represented by
 - 1 (2) 3 4 (5) 6 7

 We shall omit all the grey parts in the future (i.e., we will draw only one copy of each site).

• Let q be a queue, and u a word. We shall define a word q(u).

• Let q be a queue, and u a word. We shall define a word q(u).

• Algorithm:

- Draw u on top.
- Draw q as circles in the middle.
- Build q(u) letter by letter, as follows...

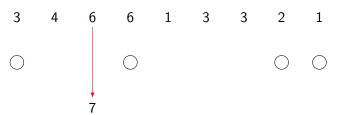

Example: n = 9 and u = 346613321 and $q = \{1, 4, 8, 9\}$:

3 4 6 6 1 3 3 2

 \circ

- Let q be a queue, and u a word. We shall define a word q(u).
- Algorithm:
 - Draw u on top.
 - Draw q as circles in the middle.
 - Build q(u) letter by letter, as follows...

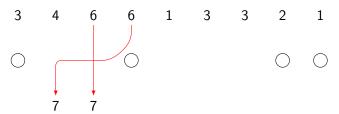

Example: n = 9 and u = 346613321 and $q = \{1, 4, 8, 9\}$:

- drop this letter down and add 1 to it;
- **move** it left until hitting some unoccupied site $i \notin q$;
- place it there.

- Let q be a queue, and u a word. We shall define a word q(u).
- Algorithm:
 - Draw u on top.
 - Draw q as circles in the middle.
 - Build q(u) letter by letter, as follows...

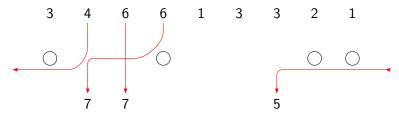

Example: n = 9 and u = 346613321 and $q = \{1, 4, 8, 9\}$:

- drop this letter down and add 1 to it;
- **move** it left until hitting some unoccupied site $i \notin q$;

 - Draw q as circles in the middle.
 - Build q(u) letter by letter, as follows...

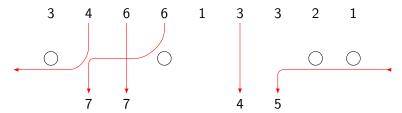

Example: n = 9 and u = 346613321 and $q = \{1, 4, 8, 9\}$:

The letters on the bottom now form q(u).

- Let q be a queue, and u a word. We shall define a word q(u).
- Algorithm:
 - Draw u on top.
 - Draw q as circles in the middle.
 - Build q(u) letter by letter, as follows...

Example: n = 9 and u = 346613321 and $q = \{1, 4, 8, 9\}$:

The letters on the bottom now form q(u).

Proposition. Equal letters can be processed in any order.

Action of queues on words, 2: formal definition

• Let q be a queue, and u a word. Define a word q(u) as follows:

In the beginning, v=q(u) is a word whose letters are unset. Choose a permutation (i_1,i_2,\ldots,i_n) of $(1,2,\ldots,n)$ such that $u_{i_1} \leq u_{i_2} \leq \cdots \leq u_{i_n}$.

Phase I. For $i=i_n,i_{n-1},\ldots,i_{|q|+1}$, do the following: Find the first site j weakly to the left (cyclically) of i such that $j\notin q$ and v_j is not set. Then set $v_j=u_i+1$.

Phase II. For $i=i_1,i_2,\ldots,i_{|q|}$, do the following: Find the first site j weakly to the right (cyclically) of i such that $j\in q$ and v_j is not set. Then set $v_j=u_i$.

Action of queues on words, 2: formal definition

• Let q be a queue, and u a word. Define a word q(u) as follows:

In the beginning, v=q(u) is a word whose letters are unset. Choose a permutation (i_1,i_2,\ldots,i_n) of $(1,2,\ldots,n)$ such that $u_{i_1} \leq u_{i_2} \leq \cdots \leq u_{i_n}$.

Phase I. For $i=i_n,i_{n-1},\ldots,i_{|q|+1}$, do the following: Find the first site j weakly to the left (cyclically) of i such that $j\notin q$ and v_j is not set. Then set $v_j=u_i+1$.

Phase II. For $i=i_1,i_2,\ldots,i_{|q|}$, do the following: Find the first site j weakly to the right (cyclically) of i such that $j\in q$ and v_j is not set. Then set $v_i=u_i$.

Proposition.

- The resulting word v = q(u) does not depend on the choice of permutation (i_1, i_2, \dots, i_n) .
- Phase I and Phase II can be done in parallel.

Remark on TASEP connection

This action of queues on words is the "generalized Ferrari-Martin algorithm" of Arita, Ayyer, Mallick and Prolhac (arXiv:1104.3752, J. Phys. A, 2011), extending a simpler procedure by Ferrari and Martin (arXiv:math-ph/0509045).

Remark on TASEP connection

- This action of queues on words is the "generalized Ferrari-Martin algorithm" of Arita, Ayyer, Mallick and Prolhac (arXiv:1104.3752, J. Phys. A, 2011), extending a simpler procedure by Ferrari and Martin (arXiv:math-ph/0509045).
- Their motivation: compute stationary distribution of multi-species TASEP (totally asymmetric simple exclusion process) on a circle.
 - The algorithm intertwines different TASEPs, and lets one transport the stationary distribution from one to another.

Remark on TASEP connection

- This action of queues on words is the "generalized Ferrari-Martin algorithm" of Arita, Ayyer, Mallick and Prolhac (arXiv:1104.3752, J. Phys. A, 2011), extending a simpler procedure by Ferrari and Martin (arXiv:math-ph/0509045).
- Their motivation: compute stationary distribution of multi-species TASEP (totally asymmetric simple exclusion process) on a circle.
 The algorithm intertwines different TASEPs, and lets one
 - transport the stationary distribution from one to another.
- Aas and Linusson (arXiv:1501.04417, Ann. Inst. Henri Poincaré D) later attempted to obtain explicit formulas for steady state probabilities.
 - Our work proves two of their conjectures.

• The *type* of a word u is the sequence $\mathbf{m} = (m_1, m_2, ...)$, where $m_k = (\# \text{ of all sites } i \text{ such that } u_i = k)$.

• The *type* of a word u is the sequence $\mathbf{m} = (m_1, m_2, \ldots)$, where $m_k = (\# \text{ of all sites } i \text{ such that } u_i = k)$. Example: The word 1255135 has type $(2, 1, 1, 0, 3, 0, 0, 0, \ldots)$.

- The *type* of a word u is the sequence $\mathbf{m} = (m_1, m_2, \ldots)$, where $m_k = (\# \text{ of all sites } i \text{ such that } u_i = k)$. Example: The word 1255135 has type $(2, 1, 1, 0, 3, 0, 0, 0, \ldots)$.
- We omit trailing zeroes from infinite sequences. That is, we abbreviate $(m_1, m_2, \ldots, m_k, 0, 0, 0, \ldots)$ as (m_1, m_2, \ldots, m_k) .

- The *type* of a word u is the sequence $\mathbf{m} = (m_1, m_2, \ldots)$, where $m_k = (\# \text{ of all sites } i \text{ such that } u_i = k)$. Example: The word 1255135 has type (2, 1, 1, 0, 3).
- We omit trailing zeroes from infinite sequences. That is, we abbreviate $(m_1, m_2, \ldots, m_k, 0, 0, 0, \ldots)$ as (m_1, m_2, \ldots, m_k) .

- The *type* of a word u is the sequence $\mathbf{m} = (m_1, m_2, \ldots)$, where $m_k = (\# \text{ of all sites } i \text{ such that } u_i = k)$. Example: The word 1255135 has type (2, 1, 1, 0, 3).
- We omit trailing zeroes from infinite sequences. That is, we abbreviate $(m_1, m_2, \ldots, m_k, 0, 0, 0, \ldots)$ as (m_1, m_2, \ldots, m_k) .
- A word u is packed with ℓ classes if its type \mathbf{m} has $m_1, m_2, \dots, m_{\ell} > 0$ and $m_{\ell+1} = m_{\ell+2} = \dots = 0$.

- The *type* of a word u is the sequence $\mathbf{m} = (m_1, m_2, \ldots)$, where $m_k = (\# \text{ of all sites } i \text{ such that } u_i = k)$. Example: The word 1255135 has type (2, 1, 1, 0, 3).
- We omit trailing zeroes from infinite sequences. That is, we abbreviate $(m_1, m_2, \ldots, m_k, 0, 0, 0, \ldots)$ as (m_1, m_2, \ldots, m_k) .
- A word u is packed with ℓ classes if its type \mathbf{m} has $m_1, m_2, \ldots, m_\ell > 0$ and $m_{\ell+1} = m_{\ell+2} = \cdots = 0$. Example: The word 1255135 is not packed. The word 1244134 is packed with 4 classes.

MLQs

• A MLQ (short for "multiline queue") is a tuple of queues.

MLQs

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q}=(q_1,q_2,\ldots,q_k)$ is an MLQ, and u is a word, then $\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)\right)\right)\right).$

MLQs

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q} = (q_1, q_2, \dots, q_k)$ is an MLQ, and u is a word, then

$$\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)
ight)
ight)
ight).$$

• Let $\ell > 0$, and let σ be a permutation of $\lceil \ell - 1 \rceil$. Let $\mathbf{m} = (m_1, m_2, \dots, m_\ell)$ be a sequence of positive integers. A σ -twisted MLQ of type **m** means an MLQ $\mathbf{q} = (q_1, q_2, \dots, q_{\ell-1})$ such that $|q_i| = m_1 + m_2 + \cdots + m_{\sigma(i)}$ for all i, and

$$|a_i|=m_1+m_2+\cdots+m_{\sigma(i)}$$
 for all $i,$ and $n=m_1+m_2+\cdots$.

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q}=(q_1,q_2,\ldots,q_k)$ is an MLQ, and u is a word, then $\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)\right)\right)\right).$
- Let $\ell > 0$, and let σ be a permutation of $[\ell-1]$. Let $\mathbf{m} = (m_1, m_2, \ldots, m_\ell)$ be a sequence of positive integers. A σ -twisted MLQ of type \mathbf{m} means an MLQ $\mathbf{q} = (q_1, q_2, \ldots, q_{\ell-1})$ such that $|q_i| = m_1 + m_2 + \cdots + m_{\sigma(i)}$ for all i, and

 $n=m_1+m_2+\cdots$.

Example: n=6 and $\mathbf{m}=(2,3,1)$ and $\ell=3$ and $\sigma=(2,1)$ (one-line notation). Then, a σ -twisted MLQ of type \mathbf{m} is an MLQ $\mathbf{q}=(q_1,q_2)$ with $|q_1|=m_1+m_2=2+3=5$ and $|q_2|=m_1=2$.

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q}=(q_1,q_2,\ldots,q_k)$ is an MLQ, and u is a word, then $\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)\right)\right)\right).$
- Let $\ell > 0$, and let σ be a permutation of $[\ell-1]$. Let $\mathbf{m} = (m_1, m_2, \ldots, m_\ell)$ be a sequence of positive integers. A σ -twisted MLQ of type \mathbf{m} means an MLQ $\mathbf{q} = (q_1, q_2, \ldots, q_{\ell-1})$ such that $|q_i| = m_1 + m_2 + \cdots + m_{\sigma(i)}$ for all i, and

 $n=m_1+m_2+\cdots$

Example: n=6 and $\mathbf{m}=(2,3,1)$ and $\ell=3$ and $\sigma=(2,1)$ (one-line notation). Then, a σ -twisted MLQ of type \mathbf{m} is an MLQ $\mathbf{q}=(q_1,q_2)$ with $|q_1|=m_1+m_2=2+3=5$ and $|q_2|=m_1=2$. For example, $\mathbf{q}=(\{1,3,4,5,6\},\{2,3\})$

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q}=(q_1,q_2,\ldots,q_k)$ is an MLQ, and u is a word, then $\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)\right)\right)\right).$
- Let $\ell > 0$, and let σ be a permutation of $[\ell-1]$. Let $\mathbf{m} = (m_1, m_2, \ldots, m_\ell)$ be a sequence of positive integers. A σ -twisted MLQ of type \mathbf{m} means an MLQ $\mathbf{q} = (q_1, q_2, \ldots, q_{\ell-1})$ such that $|q_i| = m_1 + m_2 + \cdots + m_{\sigma(i)}$ for all i, and

$$q_i|=m_1+m_2+\cdots+m_{\sigma(i)}$$
 for all i , and $n=m_1+m_2+\cdots$

Example: n = 6 and $\mathbf{m} = (2,3,1)$ and $\ell = 3$ and $\sigma = (2,1)$ (one-line notation). Then, a σ -twisted MLQ of type \mathbf{m} is an MLQ $\mathbf{q} = (q_1,q_2)$ with $|q_1| = m_1 + m_2 = 2 + 3 = 5$ and $|q_2| = m_1 = 2$. For example, $\mathbf{q} = (\{1,3,4,5,6\},\{2,3\})$ and $\mathbf{q}(111111) = 311222$.

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q}=(q_1,q_2,\ldots,q_k)$ is an MLQ, and u is a word, then $\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)\right)\right)\right).$
- Let $\ell > 0$, and let σ be a permutation of $[\ell-1]$. Let $\mathbf{m} = (m_1, m_2, \ldots, m_\ell)$ be a sequence of positive integers. A σ -twisted MLQ of type \mathbf{m} means an MLQ $\mathbf{q} = (q_1, q_2, \ldots, q_{\ell-1})$ such that $|q_i| = m_1 + m_2 + \cdots + m_{\sigma(i)}$ for all i, and

 $n=m_1+m_2+\cdots$

Example: n = 6 and $\mathbf{m} = (2, 3, 1)$ and $\ell = 3$ and $\sigma = (2, 1)$ (one-line notation). Then, a σ -twisted MLQ of type \mathbf{m} is an MLQ $\mathbf{q} = (q_1, q_2)$ with $|q_1| = m_1 + m_2 = 2 + 3 = 5$ and $|q_2| = m_1 = 2$. For example, $\mathbf{q} = (\{1, 3, 4, 5, 6\}, \{4, 5\})$

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q}=(q_1,q_2,\ldots,q_k)$ is an MLQ, and u is a word, then $\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)\right)\right)\right).$
- Let $\ell > 0$, and let σ be a permutation of $[\ell-1]$. Let $\mathbf{m} = (m_1, m_2, \ldots, m_\ell)$ be a sequence of positive integers. A σ -twisted MLQ of type \mathbf{m} means an MLQ $\mathbf{q} = (q_1, q_2, \ldots, q_{\ell-1})$ such that $|q_i| = m_1 + m_2 + \cdots + m_{\sigma(i)}$ for all i, and

$$|a_i| = m_1 + m_2 + \cdots + m_{\sigma(i)}$$
 for all $i,$ and $n = m_1 + m_2 + \cdots$.

Example: n=6 and ${\bf m}=(2,3,1)$ and $\ell=3$ and $\sigma=(2,1)$ (one-line notation). Then, a σ -twisted MLQ of type ${\bf m}$ is an MLQ ${\bf q}=(q_1,q_2)$ with $|q_1|=m_1+m_2=2+3=5$ and $|q_2|=m_1=2$. For example, ${\bf q}=(\{1,3,4,5,6\},\{4,5\})$ and ${\bf q}(111111)=232112$.

- A MLQ (short for "multiline queue") is a tuple of queues.
- If $\mathbf{q}=(q_1,q_2,\ldots,q_k)$ is an MLQ, and u is a word, then $\mathbf{q}(u):=q_k\left(q_{k-1}\left(\cdots\left(q_1(u)\right)\right)\right).$
- Let $\ell > 0$, and let σ be a permutation of $[\ell 1]$. Let $\mathbf{m} = (m_1, m_2, \dots, m_\ell)$ be a sequence of positive integers. A σ -twisted MLQ of type \mathbf{m} means an MLQ $\mathbf{q} = (q_1, q_2, \dots, q_{\ell-1})$ such that $|q_i| = m_1 + m_2 + \dots + m_{\sigma(i)}$ for all i, and $n = m_1 + m_2 + \dots$
- Equivalently: A σ -twisted MLQ of type \mathbf{m} can be defined as an MLQ $\mathbf{q}=(q_1,q_2,\ldots,q_{\ell-1})$ such that
 - the word $\mathbf{q}(1\cdots 1)$ has type \mathbf{m} (where $1\cdots 1$ is the word whose entries all equal 1);
 - we have $0<\left|q_{\sigma^{-1}(1)}\right|<\left|q_{\sigma^{-1}(2)}\right|<\dots<\left|q_{\sigma^{-1}(\ell-1)}\right|.$

• Now, let x_1, x_2, \ldots, x_n be commuting variables.

- Now, let x_1, x_2, \ldots, x_n be commuting variables.
- For any $\ell \geq 1$, any permutation σ of $[\ell-1]$, and any packed word u of type \mathbf{m} with ℓ classes, we define the σ -spectral weight $\langle u \rangle_{\sigma}$ by

$$\left\langle u\right\rangle _{\sigma}:=\sum_{\substack{\mathbf{q}\text{ is a }\sigma\text{-twisted}\\\mathrm{MLQ}\text{ of type }\mathbf{m}\\\mathrm{satisfying }u=\mathbf{q}(1\cdots 1)}}\mathrm{wt}\,\mathbf{q}$$

Here:

- $1 \cdots 1$ denotes the word whose all entries are 1.
- wt $\mathbf{q} := \prod_{p=1} \prod_{i \in q_p} x_i$ for any MLQ $\mathbf{q} = (q_1, q_2, \dots, q_k)$.

- Now, let x_1, x_2, \ldots, x_n be commuting variables.
- For any $\ell \geq 1$, any permutation σ of $[\ell-1]$, and any packed word u of type \mathbf{m} with ℓ classes, we define the σ -spectral weight $\langle u \rangle_{\sigma}$ by

$$\langle u \rangle_{\sigma} := \sum_{\substack{\mathbf{q} \text{ is a } \sigma\text{-twisted} \\ \text{MLQ of type } \mathbf{m} \\ \text{satisfying } u = \mathbf{q}(1\cdots 1)}} \text{wt } \mathbf{q}.$$

Here:

- $1 \cdots 1$ denotes the word whose all entries are 1.
- wt $\mathbf{q} := \prod_{p=1}^n \prod_{i \in q_p} x_i$ for any MLQ $\mathbf{q} = (q_1, q_2, \dots, q_k)$.

Example: Recall that $(\{1,3,4,5,6\},\{4,5\})$ is a σ -twisted MLQ of type \mathbf{m} for n=6 and $\mathbf{m}=(2,3,1)$ and $\ell=3$ and $\sigma=(2,1)$ (one-line notation) satisfying $\mathbf{q}(111111)=232112$. It contributes a monomial

$$(x_1x_3x_4x_5x_6)(x_4x_5) = x_1x_3x_4^2x_5^2x_6$$
 to $\langle 232112 \rangle_{\sigma}$.

- Now, let x_1, x_2, \ldots, x_n be commuting variables.
- For any $\ell \geq 1$, any permutation σ of $[\ell-1]$, and any packed word u of type \mathbf{m} with ℓ classes, we define the σ -spectral weight $\langle u \rangle_{\sigma}$ by

$$\langle u \rangle_{\sigma} := \sum_{\substack{\mathbf{q} \text{ is a } \sigma\text{-twisted} \\ \text{MLQ of type } \mathbf{m} \\ \text{satisfying } u = \mathbf{q}(1\cdots 1)}} \text{wt } \mathbf{q}.$$

Here:

- $1 \cdots 1$ denotes the word whose all entries are 1.
- wt $\mathbf{q} := \prod_{p=1}^n \prod_{i \in q_p} x_i$ for any MLQ $\mathbf{q} = (q_1, q_2, \dots, q_k)$.
- Set $\langle u \rangle := \langle u \rangle_{\mathsf{id}}$ for the permutation id of $[\ell 1]$.

Generating functions, 2: more examples

• Example: For n = 5, $\ell = 5$ and $\mathbf{m} = (1, 1, 2, 1)$, we have $\langle 13234 \rangle = x_1 x_2 x_3^2 x_4 (x_1^2 + x_1 x_4 + x_1 x_5 + x_4 x_5 + x_5^2)$.

Generating functions, 2: more examples

- Example: For n = 5, $\ell = 5$ and $\mathbf{m} = (1, 1, 2, 1)$, we have $\langle 13234 \rangle = x_1 x_2 x_3^2 x_4 (x_1^2 + x_1 x_4 + x_1 x_5 + x_4 x_5 + x_5^2)$.
- Examples: For n = 5, $\ell = 5$ and $\mathbf{m} = (1, 1, 1, 1, 1)$, we have $\langle 13245 \rangle = x_1 x_2 x_3^2 x_4 (x_1^2 + x_1 x_4 + x_1 x_5 + x_4^2 + x_4 x_5 + x_5^2)$ $(x_1x_2x_3 + x_1x_2x_5 + x_1x_3x_5 + x_2x_3x_5),$ $\langle 14235 \rangle = x_1 x_2 x_3^2 x_4^2 (x_1^3 x_2 + x_1^3 x_3 + x_1^3 x_5 + x_1^2 x_2 x_3 + x_1^2 x_2 x_4)$ $+2x_1^2x_2x_5 + x_1^2x_3x_4 + 2x_1^2x_3x_5 + x_1^2x_4x_5$ $+x_1^2x_5^2+x_1x_2x_3x_5+x_1x_2x_4x_5+2x_1x_2x_5^2$ $+ x_1 x_3 x_4 x_5 + 2 x_1 x_3 x_5^2 + x_1 x_4 x_5^2 + x_1 x_5^3$ $+ x_2 x_3 x_5^2 + x_2 x_4 x_5^2 + x_2 x_5^3 + x_3 x_4 x_5^2 + x_3 x_5^3$).

The symmetry theorem, 1: statement

• Theorem. For any $\ell \geq 1$, any permutation σ of $[\ell-1]$, and any packed word u of type ${\bf m}$ with ℓ classes, we have

$$\langle u \rangle_{\sigma} = \langle u \rangle$$
.

The symmetry theorem, 1: statement

• Theorem. For any $\ell \geq 1$, any permutation σ of $[\ell-1]$, and any packed word u of type ${\bf m}$ with ℓ classes, we have

$$\langle u \rangle_{\sigma} = \langle u \rangle$$
.

 This yields the "commutativity conjecture" by Arita, Ayyer, Mallick and Prolhac on the TASEP (arXiv:1104.3752).

The symmetry theorem, 1: statement

• Theorem. For any $\ell \geq 1$, any permutation σ of $[\ell-1]$, and any packed word u of type ${\bf m}$ with ℓ classes, we have

$$\langle u \rangle_{\sigma} = \langle u \rangle$$
.

- This yields the "commutativity conjecture" by Arita, Ayyer, Mallick and Prolhac on the TASEP (arXiv:1104.3752).
- This is proven bijectively, using a "duality transformation" on MLQs that leaves their action on words unchanged.
- Main lemma. If q_1 and q_2 are two queues, then there are two queues q'_1 and q'_2 satisfying

$$\left|q_1'\right| = \left|q_2\right|$$
 and $\left|q_2'\right| = \left|q_1\right|$ and $\left(\prod_{i \in q_1'} x_i\right) \left(\prod_{i \in q_2'} x_i\right) = \left(\prod_{i \in q_1} x_i\right) \left(\prod_{i \in q_2} x_i\right)$

such that every word *u* satisfies

$$q'_1(q'_2(u)) = q_1(q_2(u)).$$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol " \circ ".

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".

Convenient example:

$$n = 10;$$

 $q_1 = \{2, 6, 7, 9\};$
 $q_2 = \{1, 3, 5, 7, 8\}.$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".

Convenient example:

$$n = 10;$$

 $q_1 = \{2, 6, 7, 9\};$
 $q_2 = \{1, 3, 5, 7, 8\}.$

Then,

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".

Convenient example:

$$n = 10;$$

 $q_1 = \{2, 6, 7, 9\};$
 $q_2 = \{1, 3, 5, 7, 8\}.$

Then,

$$b = \circ) (\circ \circ) \circ \circ \circ) (\circ () \circ) (\circ \circ)$$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".

Convenient example:

$$n = 10;$$

 $q_1 = \{2, 6, 7, 9\};$
 $q_2 = \{1, 3, 5, 7, 8\}.$

Then,

$$b = \circ)(\circ\circ)\circ\circ\circ)(\circ()\circ)(\circ\circ\circ)$$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".
 - Match parentheses in b "the usual way" but keeping in mind that the word wraps around cyclically. In our above example:

$$b = \circ)(\circ\circ)\circ\circ\circ)(\circ()\circ)(\circ\circ\circ)$$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".
 - Match parentheses in b "the usual way" but keeping in mind that the word wraps around cyclically. In our above example:

$$b = \circ)(1 \circ \circ)(1 \circ \circ)(0 \circ \circ)(0 \circ \circ)(0 \circ \circ)$$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".
 - Match parentheses in b "the usual way" but keeping in mind that the word wraps around cyclically. In our above example:

 - Replace the unmatched parentheses by their duals e.g., if they were)'s, make them ('s. In our above example:

$$b = 0)_4(100)_1000)(30(2)_20)_3(4000)$$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".
 - Match parentheses in b "the usual way" but keeping in mind that the word wraps around cyclically.
 - Replace the unmatched parentheses by their duals e.g., if they were)'s, make them ('s. In our above example:

$$b' = 0)_4(100)_1000((30(2)_20)_3(4000)_1000)$$

- The construction of q'_1 and q'_2 is combinatorial:
 - Encode the pair (q_1, q_2) as a 2n-letter word $b = (b_1, b_2, \ldots, b_{2n})$ over the 3-letter alphabet $\{), (, \circ\}$. Namely, for each i,
 - let b_{2i-1} be an opening parenthesis "(" if $i \in q_1$, otherwise a neutral symbol "o";
 - let b_{2i} be a closing parenthesis ")" if $i \in q_2$, otherwise a neutral symbol "o".
 - Match parentheses in *b* "the usual way" but keeping in mind that the word wraps around cyclically.
 - Replace the unmatched parentheses by their duals e.g., if they were)'s, make them ('s.
 - Turn the resulting word b' into two sets q'_1 and q'_2 as follows:
 - $q_1' = \{i \in [n] \mid \text{ either } b_{2i-1}' \text{ or } b_{2i}' \text{ is a "(")};$
 - $q_2' = \{i \in [n] \mid \text{ either } b_{2i-1}' \text{ or } b_{2i}' \text{ is a "}\}$ ".

The symmetry theorem, 3: comments

- Note that
 - if $|q_1| < |q_2|$, then q_1' is obtained from q_1 by adding some elements from q_2 , whereas q_2' is obtained from q_2 by removing these elements;
 - if $|q_1| = |q_2|$, then $q_1' = q_1$ and $q_2' = q_2$;
 - if $|q_1| > |q_2|$, then q_1' is obtained from q_1 by removing some elements, whereas q_2' is obtained from q_2 by adding these elements.

The symmetry theorem, 3: comments

- Note that

 - if $|q_1| = |q_2|$, then $q_1' = q_1$ and $q_2' = q_2$;
 - if $|q_1| > |q_2|$, then q_1' is obtained from q_1 by removing some elements, whereas q_2' is obtained from q_2 by adding these elements.
- This is closely connected to the Lascoux-Schützenberger action of the symmetric group on words (a.k.a. the Weyl group action on the word crystal of type A).
- Note: the map $(q_1, q_2) \mapsto (q'_1, q'_2)$ is an involution.

The symmetry theorem, 3: comments

- Note that
 - if $|q_1| < |q_2|$, then q_1' is obtained from q_1 by adding some elements from q_2 , whereas q_2' is obtained from q_2 by removing these elements;
 - ullet if $|q_1|=|q_2|$, then $q_1'=q_1$ and $q_2'=q_2$;
 - if $|q_1| > |q_2|$, then q_1' is obtained from q_1 by removing some elements, whereas q_2' is obtained from q_2 by adding these elements.
- This is closely connected to the Lascoux-Schützenberger action of the symmetric group on words (a.k.a. the Weyl group action on the word crystal of type A).
- Note: the map $(q_1, q_2) \mapsto (q'_1, q'_2)$ is an involution.
- Actually, it is a known object from crystal base theory: the combinatorial R-matrix for two single columns.

ullet But can we compute $\langle u \rangle$ without enumerating all MLQs?

- But can we compute $\langle u \rangle$ without enumerating all MLQs?
- We have a partial answer (which subsumes two conjectures by Aas and Linusson).

• **Theorem.** Let $B = \{b_1 < b_2 < \cdots < b_r\} \subseteq [n]$. Let $v_1v_2 \cdots v_r$ be a weakly decreasing (non-cyclic) packed word of length r with $\ell - 1$ classes. Define a word μ of length p by $\mu_i = v_i$ if $i = b_i$ for some i

Define a word u of length n by $u_i = v_j$ if $i = b_j$ for some j, otherwise $u_i = \ell$.

Then

$$\langle u \rangle = \left(\prod_{i \in B} x_i\right) \det \left(h_{i-j-1+\ell-\nu_j}(x_1, x_2, \dots, x_{b_j})\right)_{1 \le i, j \le r}.$$

• Theorem. Let $B = \{b_1 < b_2 < \cdots < b_r\} \subseteq [n]$. Let $v_1v_2 \cdots v_r$ be a weakly decreasing (non-cyclic) packed word of length r with $\ell-1$ classes. Define a word u of length n by $u_i = v_j$ if $i = b_j$ for some j, otherwise $u_i = \ell$.

Reminder on Schur functions

 The following is not related to MLQs (or is it?), but a conjecture I'm very curious to hear ideas about. (And it's a Jacobi-Trudi type formula, too.)

Reminder on Schur functions

- The following is not related to MLQs (or is it?), but a conjecture I'm very curious to hear ideas about.
 (And it's a Jacobi-Trudi type formula, too.)
- Fix a commutative ring **k**. Recall that for any skew partition λ/μ , the *(skew) Schur function* $s_{\lambda/\mu}$ is defined as the power series

$$\sum_{\textit{T is an SST of shape λ/μ}} \mathbf{x}^{\mathsf{cont} \; \textit{T}} \in \mathbf{k} \left[\left[x_1, x_2, x_3, \ldots \right] \right],$$

where "SST" is short for "semistandard Young tableau", and where

$$\mathbf{x}^{\text{cont }T} = \prod_{k>1} x_k^{\text{number of times }T \text{ contains entry }k}.$$

Reminder on Schur functions

- The following is not related to MLQs (or is it?), but a conjecture I'm very curious to hear ideas about.
 (And it's a Jacobi-Trudi type formula, too.)
- Fix a commutative ring **k**. Recall that for any skew partition λ/μ , the *(skew) Schur function* $s_{\lambda/\mu}$ is defined as the power series

$$\sum_{\textit{T is an SST of shape λ/μ}} \mathbf{x}^{\mathsf{cont} \; \textit{T}} \in \mathbf{k} \left[\left[x_1, x_2, x_3, \ldots \right] \right],$$

where "SST" is short for "semistandard Young tableau", and where

$$\mathbf{x}^{\text{cont }T} = \prod_{k>1} x_k^{\text{number of times }T \text{ contains entry }k}.$$

 Let us generalize this by extending the sum and introducing extra parameters.

 A reverse plane partition (RPP) is defined like an SST (semistandard Young tableau), but entries increase weakly both along rows and down columns. For example,

	1	2	2	is an	RPP.
	2	2			
2	4				

 A reverse plane partition (RPP) is defined like an SST (semistandard Young tableau), but entries increase weakly both along rows and down columns. For example,

	1	2	2	is an	RPP.
	2	2			
2	4				

(In detail: An RPP is a map T from a skew Young diagram to {positive integers} such that

$$T(i,j) \le T(i,j+1)$$
 and $T(i,j) \le T(i+1,j)$ whenever these are defined.)

 A reverse plane partition (RPP) is defined like an SST (semistandard Young tableau), but entries increase weakly both along rows and down columns. For example,

	1	2	2	is an	RPP.
	2	2			
2	4				

(In detail: An RPP is a map T from a skew Young diagram to {positive integers} such that

$$T(i,j) \le T(i,j+1)$$
 and $T(i,j) \le T(i+1,j)$

whenever these are defined.)

• Let **k** be a commutative ring, and fix any elements $t_1, t_2, t_3, \ldots \in \mathbf{k}$.

Dual stable Grothendieck polynomials, 2: definition

• Given a skew partition λ/μ , we define the *refined dual stable* Grothendieck polynomial $\widetilde{g}_{\lambda/\mu}$ to be the formal power series

$$\sum \qquad \mathbf{x}^{\text{ircont } T} \mathbf{t}^{\text{ceq } T} \in \mathbf{k} \left[\left[x_1, x_2, x_3, \ldots \right] \right],$$

T is an RPP of shape λ/μ

where

$$\mathbf{x}^{\text{ircont }T} = \prod_{k > 1} x_k^{\text{number of columns of }T}$$
 containing entry k

and

$$\mathbf{t}^{\mathsf{ceq} \; T} = \prod_{i > 1} t_i^{\mathsf{number} \; \mathsf{of} \; j \; \mathsf{such} \; \mathsf{that} \; T(i,j) = T(i+1,j)}$$

(where T(i,j) = T(i+1,j) implies, in particular, that both (i,j) and (i+1,j) are cells of T).

This is a formal power series in $x_1, x_2, x_3, ...$ (despite the name "polynomial").

Recall:

$$\mathbf{x}^{\mathrm{ircont}\,T} = \prod_{k>1} x_k^{\mathrm{number of columns of }\,T}$$
 containing entry k .

• If
$$T = \begin{array}{|c|c|c|c|c|}\hline 1 & 2 & 2\\\hline & 2 & 2\\\hline & 2 & 3\\\hline \end{array}$$
, then $\mathbf{x}^{\mathsf{ircont}\,T} = x_1x_2^4x_3$. The x_2 has

exponent 4, not 5, because the two 2's in column 3 count only once.

Recall:

$$\mathbf{x}^{\mathsf{ircont}\,T} = \prod_{k \geq 1} x_k^{\mathsf{number}}$$
 of columns of T containing entry k .

• If
$$T = \begin{array}{|c|c|c|c|c|}\hline 1 & 2 & 2\\\hline & 2 & 2\\\hline & 2 & 3\\\hline \end{array}$$
, then $\mathbf{x}^{\mathsf{ircont}\,T} = x_1x_2^4x_3$. The x_2 has

exponent 4, not 5, because the two 2's in column 3 count only once.

• If T is an SST, then $\mathbf{x}^{\text{ircont }T} = \mathbf{x}^{\text{cont }T}$.

Recall that

$$\mathbf{t}^{\mathsf{ceq} \; T} = \prod_{i \geq 1} t_i^{\mathsf{number} \; \mathsf{of} \; j \; \mathsf{such} \; \mathsf{that} \; T(i,j) = T(i+1,j)}$$

• If
$$T=egin{array}{|c|c|c|c|}\hline 1&2&2\\\hline 2&2\\\hline \hline &T&(1,3)=T&(2,3).\\\hline \end{array}$$
 , then $\mathbf{t}^{\operatorname{ceq}T}=t_1$, due to

Recall that

$$\mathbf{t}^{\mathsf{ceq} \; T} = \prod_{i \geq 1} t_i^{\mathsf{number} \; \mathsf{of} \; j \; \mathsf{such} \; \mathsf{that} \; T(i,j) = T(i+1,j)}$$

- If T is an SST, then $\mathbf{t}^{\text{ceq }T}=1$.
- In general, t^{ceq T} measures "how often" T breaks the SST condition.

• If we set $t_1=t_2=t_3=\cdots=0$, then $\widetilde{g}_{\lambda/\mu}=s_{\lambda/\mu}$.

- If we set $t_1=t_2=t_3=\cdots=0$, then $\widetilde{g}_{\lambda/\mu}=s_{\lambda/\mu}$.
- If we set $t_1=t_2=t_3=\cdots=1$, then $\widetilde{g}_{\lambda/\mu}=g_{\lambda/\mu}$, the *dual stable Grothendieck polynomial* of Lam and Pylyavskyy (arXiv:0705.2189).
- The general case, to our knowledge, is new.

- If we set $t_1=t_2=t_3=\cdots=0$, then $\widetilde{g}_{\lambda/\mu}=s_{\lambda/\mu}$.
- If we set $t_1=t_2=t_3=\cdots=1$, then $\widetilde{g}_{\lambda/\mu}=g_{\lambda/\mu}$, the *dual stable Grothendieck polynomial* of Lam and Pylyavskyy (arXiv:0705.2189).
- The general case, to our knowledge, is new.
- Theorem (Galashin, G., Liu, arXiv:1509.03803): The power series $\widetilde{g}_{\lambda/\mu}$ is symmetric in the x_i (not in the t_i).

- If we set $t_1=t_2=t_3=\cdots=0$, then $\widetilde{g}_{\lambda/\mu}=s_{\lambda/\mu}$.
- If we set $t_1=t_2=t_3=\cdots=1$, then $\widetilde{g}_{\lambda/\mu}=g_{\lambda/\mu}$, the *dual stable Grothendieck polynomial* of Lam and Pylyavskyy (arXiv:0705.2189).
- The general case, to our knowledge, is new.
- Theorem (Galashin, G., Liu, arXiv:1509.03803): The power series $\widetilde{g}_{\lambda/\mu}$ is symmetric in the x_i (not in the t_i).
- **Example 1:** If $\lambda = (n)$ and $\mu = ()$, then $\widetilde{g}_{\lambda/\mu} = h_n$, the *n*-th complete homogeneous symmetric function.

- If we set $t_1=t_2=t_3=\cdots=0$, then $\widetilde{g}_{\lambda/\mu}=s_{\lambda/\mu}$.
- If we set $t_1=t_2=t_3=\cdots=1$, then $\widetilde{g}_{\lambda/\mu}=g_{\lambda/\mu}$, the *dual stable Grothendieck polynomial* of Lam and Pylyavskyy (arXiv:0705.2189).

- Example 1: If $\lambda = (n)$ and $\mu = ()$, then $\widetilde{g}_{\lambda/\mu} = h_n$, the *n*-th complete homogeneous symmetric function.
- Example 2: If $\lambda = \underbrace{\left(\underbrace{1,1,\ldots,1}_{n \text{ ones}}\right)}$ and $\mu = ()$, then $\widetilde{g}_{\lambda/\mu} = e_n \, (t_1,t_2,\ldots,t_{n-1},x_1,x_2,x_3,\ldots)$, where e_n is the n-th elementary symmetric function.
- Example 3: If $\lambda = (2,1)$ and $\mu = ()$, then $\widetilde{g}_{\lambda/\mu} = \sum_{a \le b; \ a < c} x_a x_b x_c + t_1 \sum_{a \le b} x_a x_b = s_{(2,1)} + t_1 s_{(2)}$.

• Conjecture: Let the conjugate partitions of λ and μ be $\lambda^t = ((\lambda^t)_1, (\lambda^t)_2, \dots, (\lambda^t)_N)$ and $\mu^t = ((\mu^t)_1, (\mu^t)_2, \dots, (\mu^t)_N)$. Then,

$$\begin{split} &\widetilde{g}_{\lambda/\mu} \\ &= \det \left(\left(e_{(\lambda^t)_i - i - (\mu^t)_j + j} \left(\mathbf{x}, \mathbf{t} \left[\left(\mu^t \right)_j + 1 : \left(\lambda^t \right)_i \right] \right) \right)_{1 \leq i \leq N, \ 1 \leq j \leq N} \right). \end{split}$$

Here, $(\mathbf{x}, \mathbf{t} [k : \ell])$ denotes the alphabet $(x_1, x_2, x_3, \dots, t_k, t_{k+1}, \dots, t_{\ell-1})$.

Warning: If $\ell \leq k$, then $t_k, t_{k+1}, \ldots, t_{\ell-1}$ means nothing. No "antimatter" variables!

• Conjecture: Let the conjugate partitions of λ and μ be $\lambda^t = ((\lambda^t)_1, (\lambda^t)_2, \dots, (\lambda^t)_N)$ and $\mu^t = ((\mu^t)_1, (\mu^t)_2, \dots, (\mu^t)_N)$. Then,

$$\begin{split} &\widetilde{\mathbf{g}}_{\boldsymbol{\lambda}/\boldsymbol{\mu}} \\ &= \det \left(\left(e_{\left(\boldsymbol{\lambda}^t\right)_i - i - \left(\boldsymbol{\mu}^t\right)_j + j} \left(\mathbf{x}, \mathbf{t} \left[\left(\boldsymbol{\mu}^t\right)_j + 1 : \left(\boldsymbol{\lambda}^t\right)_i \right] \right) \right)_{1 \leq i \leq N, \ 1 \leq j \leq N} \right). \end{split}$$

Here, $(\mathbf{x}, \mathbf{t} [k : \ell])$ denotes the alphabet $(x_1, x_2, x_3, \dots, t_k, t_{k+1}, \dots, t_{\ell-1})$.

Warning: If $\ell \leq k$, then $t_k, t_{k+1}, \ldots, t_{\ell-1}$ means nothing. No "antimatter" variables!

• This would generalize the Jacobi-Trudi identity for Schur functions in terms of e_i 's.

• Conjecture: Let the conjugate partitions of λ and μ be $\lambda^t = ((\lambda^t)_1, (\lambda^t)_2, \dots, (\lambda^t)_N)$ and $\mu^t = ((\mu^t)_1, (\mu^t)_2, \dots, (\mu^t)_N)$. Then,

$$\begin{split} &\widetilde{\mathbf{g}}_{\boldsymbol{\lambda}/\boldsymbol{\mu}} \\ &= \det \left(\left(e_{(\boldsymbol{\lambda}^t)_i - i - (\boldsymbol{\mu}^t)_j + j} \left(\mathbf{x}, \mathbf{t} \left[\left(\boldsymbol{\mu}^t \right)_j + 1 : \left(\boldsymbol{\lambda}^t \right)_i \right] \right) \right)_{1 \leq i \leq N, \ 1 \leq j \leq N} \right). \end{split}$$

Here, $(\mathbf{x}, \mathbf{t} [k : \ell])$ denotes the alphabet $(x_1, x_2, x_3, \dots, t_k, t_{k+1}, \dots, t_{\ell-1})$.

Warning: If $\ell \leq k$, then $t_k, t_{k+1}, \ldots, t_{\ell-1}$ means nothing. No "antimatter" variables!

- This would generalize the Jacobi-Trudi identity for Schur functions in terms of e_i 's.
- I have some even stronger conjectures, with less evidence...

- I have some even stronger conjectures, with less evidence...
- The case $\mu = \emptyset$ has been proven by Damir Yeliussizov in arXiv:1601.01581.

Thank you

- Ricky Liu for the invitation.
- Erik Aas and Travis Scrimshaw for collaboration.
- you for attending.
