#### What is this about?

 From a modern point of view, Schubert calculus (a.k.a. classical enumerative geometry, or Hilbert's 15th problem) is about two cohomology rings:

$$H^* \left( \underbrace{Gr(k, n)}_{Grassmannian} \right)$$
 and  $H^* \left( \underbrace{Fl(n)}_{flag \ variety} \right)$ 

(both varieties over  $\mathbb{C}$ ).

#### What is this about?

From a modern point of view, Schubert calculus (a.k.a. classical enumerative geometry, or Hilbert's 15th problem) is about two cohomology rings:

$$H^* \left( \underbrace{Gr(k, n)}_{Grassmannian} \right)$$
 and  $H^* \left( \underbrace{Fl(n)}_{flag \ variety} \right)$ 

(both varieties over  $\mathbb{C}$ ).

• In this talk, we are concerned with the first.

#### What is this about?

 From a modern point of view, Schubert calculus (a.k.a. classical enumerative geometry, or Hilbert's 15th problem) is about two cohomology rings:

$$H^* \left( \underbrace{Gr(k, n)}_{Grassmannian} \right)$$
 and  $H^* \left( \underbrace{Fl(n)}_{flag \ variety} \right)$ 

(both varieties over  $\mathbb{C}$ ).

- In this talk, we are concerned with the first.
- Classical result: as rings,

$$\mathsf{H}^*(\mathsf{Gr}(k,n))$$
 $\cong (\mathsf{symmetric} \ \mathsf{polynomials} \ \mathsf{in} \ x_1, x_2, \dots, x_k \ \mathsf{over} \ \mathbb{Z})$ 
 $/(h_{n-k+1}, h_{n-k+2}, \dots, h_n)_{\mathsf{ideal}},$ 

where the  $h_i$  are complete homogeneous symmetric polynomials (to be defined soon).

## **Quantum cohomology of** Gr(k, n)

 (Small) Quantum cohomology is a deformation of cohomology from the 1980–90s. For the Grassmannian, it is

QH\* (Gr 
$$(k, n)$$
)
$$\cong \text{(symmetric polynomials in } x_1, x_2, \dots, x_k \text{ over } \mathbb{Z}[q]\text{)}$$

$$/ \left(h_{n-k+1}, h_{n-k+2}, \dots, h_{n-1}, h_n + (-1)^k q\right)_{\text{ideal}}.$$

## Quantum cohomology of Gr(k, n)

 (Small) Quantum cohomology is a deformation of cohomology from the 1980-90s. For the Grassmannian, it is

QH\* (Gr 
$$(k, n)$$
)
$$\cong (\text{symmetric polynomials in } x_1, x_2, \dots, x_k \text{ over } \mathbb{Z}[q])$$

$$/ \left(h_{n-k+1}, h_{n-k+2}, \dots, h_{n-1}, h_n + (-1)^k q\right)_{\text{ideal}}.$$

- Many properties of classical cohomology still hold here. In particular: QH\* (Gr (k, n)) has a  $\mathbb{Z}[q]$ -module basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  of (projected) Schur polynomials (to be defined soon), with  $\lambda$  ranging over all partitions with  $\leq k$  parts and each part  $\leq n - k$ . The structure constants are the **Gromov–Witten invariants**. References:

• **Goal:** Deform  $H^*(Gr(k, n))$  using k parameters instead of one, generalizing  $QH^*(Gr(k, n))$ .

- **Goal:** Deform  $H^*(Gr(k, n))$  using k parameters instead of one, generalizing  $QH^*(Gr(k, n))$ .
- The new ring has no geometric interpretation known so far, but various properties suggesting such an interpretation likely exists.

- **Goal:** Deform  $H^*(Gr(k, n))$  using k parameters instead of one, generalizing  $QH^*(Gr(k, n))$ .
- The new ring has no geometric interpretation known so far, but various properties suggesting such an interpretation likely exists.
- I will now start from scratch and define standard notations around symmetric polynomials, then introduce the deformed cohomology ring algebraically.

- **Goal:** Deform  $H^*(Gr(k, n))$  using k parameters instead of one, generalizing  $QH^*(Gr(k, n))$ .
- The new ring has no geometric interpretation known so far, but various properties suggesting such an interpretation likely exists.
- I will now start from scratch and define standard notations around symmetric polynomials, then introduce the deformed cohomology ring algebraically.
- There is a number of open questions and things to explore.

• Let k be a commutative ring. Let  $\mathbb{N} = \{0, 1, 2, \ldots\}$ . Let  $k \in \mathbb{N}$ .

- Let k be a commutative ring. Let  $\mathbb{N} = \{0, 1, 2, ...\}$ . Let  $k \in \mathbb{N}$ .
- Let  $\mathcal{P} = \mathbf{k} [x_1, x_2, \dots, x_k]$  be the polynomial ring in k indeterminates over  $\mathbf{k}$ .

- Let k be a commutative ring. Let  $\mathbb{N} = \{0, 1, 2, ...\}$ . Let  $k \in \mathbb{N}$ .
- Let  $\mathcal{P} = \mathbf{k} [x_1, x_2, \dots, x_k]$  be the polynomial ring in k indeterminates over  $\mathbf{k}$ .
- For each k-tuple  $\alpha \in \mathbb{N}^k$  and each  $i \in \{1, 2, ..., k\}$ , let  $\alpha_i$  be the i-th entry of  $\alpha$ . Same for infinite sequences.

- Let k be a commutative ring. Let  $\mathbb{N} = \{0, 1, 2, ...\}$ . Let  $k \in \mathbb{N}$ .
- Let  $\mathcal{P} = \mathbf{k} [x_1, x_2, \dots, x_k]$  be the polynomial ring in k indeterminates over  $\mathbf{k}$ .
- For each k-tuple  $\alpha \in \mathbb{N}^k$  and each  $i \in \{1, 2, ..., k\}$ , let  $\alpha_i$  be the i-th entry of  $\alpha$ . Same for infinite sequences.
- For each  $\alpha \in \mathbb{N}^k$ , let  $\mathbf{x}^{\alpha}$  be the monomial  $\mathbf{x}_1^{\alpha_1} \mathbf{x}_2^{\alpha_2} \cdots \mathbf{x}_k^{\alpha_k}$ , and let  $|\alpha|$  be the degree  $\alpha_1 + \alpha_2 + \cdots + \alpha_k$  of this monomial.

- Let k be a commutative ring. Let  $\mathbb{N} = \{0, 1, 2, ...\}$ . Let  $k \in \mathbb{N}$ .
- Let  $\mathcal{P} = \mathbf{k} [x_1, x_2, \dots, x_k]$  be the polynomial ring in k indeterminates over  $\mathbf{k}$ .
- For each k-tuple  $\alpha \in \mathbb{N}^k$  and each  $i \in \{1, 2, ..., k\}$ , let  $\alpha_i$  be the i-th entry of  $\alpha$ . Same for infinite sequences.
- For each  $\alpha \in \mathbb{N}^k$ , let  $\mathbf{x}^{\alpha}$  be the monomial  $\mathbf{x}_1^{\alpha_1} \mathbf{x}_2^{\alpha_2} \cdots \mathbf{x}_k^{\alpha_k}$ , and let  $|\alpha|$  be the degree  $\alpha_1 + \alpha_2 + \cdots + \alpha_k$  of this monomial.
- Let  $\mathcal S$  denote the ring of *symmetric* polynomials in  $\mathcal P$ . These are the polynomials  $f \in \mathcal P$  satisfying

$$f(x_1, x_2, \dots, x_k) = f(x_{\sigma(1)}, x_{\sigma(2)}, \dots, x_{\sigma(k)})$$

for all permutations  $\sigma$  of  $\{1, 2, \dots, k\}$ .

- Let k be a commutative ring. Let  $\mathbb{N} = \{0, 1, 2, ...\}$ . Let  $k \in \mathbb{N}$ .
- Let  $\mathcal{P} = \mathbf{k} [x_1, x_2, \dots, x_k]$  be the polynomial ring in k indeterminates over  $\mathbf{k}$ .
- For each k-tuple  $\alpha \in \mathbb{N}^k$  and each  $i \in \{1, 2, ..., k\}$ , let  $\alpha_i$  be the i-th entry of  $\alpha$ . Same for infinite sequences.
- For each  $\alpha \in \mathbb{N}^k$ , let  $\mathbf{x}^{\alpha}$  be the monomial  $\mathbf{x}_1^{\alpha_1} \mathbf{x}_2^{\alpha_2} \cdots \mathbf{x}_k^{\alpha_k}$ , and let  $|\alpha|$  be the degree  $\alpha_1 + \alpha_2 + \cdots + \alpha_k$  of this monomial.
- Let  $\mathcal S$  denote the ring of *symmetric* polynomials in  $\mathcal P$ . These are the polynomials  $f \in \mathcal P$  satisfying

$$f(x_1, x_2, \dots, x_k) = f(x_{\sigma(1)}, x_{\sigma(2)}, \dots, x_{\sigma(k)})$$

for all permutations  $\sigma$  of  $\{1, 2, ..., k\}$ .

• Theorem (Artin  $\leq$ 1944): The S-module  $\mathcal{P}$  is free with basis

$$(x^{\alpha})_{\alpha \in \mathbb{N}^k; \ \alpha_i < i \text{ for each } i}$$
 (or, informally: " $(x_1^{<1} x_2^{<2} \cdots x_k^{< k})$ ").

- Let k be a commutative ring. Let  $\mathbb{N} = \{0, 1, 2, ...\}$ . Let  $k \in \mathbb{N}$ .
- Let  $\mathcal{P} = \mathbf{k} [x_1, x_2, \dots, x_k]$  be the polynomial ring in k indeterminates over  $\mathbf{k}$ .
- For each k-tuple  $\alpha \in \mathbb{N}^k$  and each  $i \in \{1, 2, ..., k\}$ , let  $\alpha_i$  be the i-th entry of  $\alpha$ . Same for infinite sequences.
- For each  $\alpha \in \mathbb{N}^k$ , let  $\mathbf{x}^{\alpha}$  be the monomial  $\mathbf{x}_1^{\alpha_1} \mathbf{x}_2^{\alpha_2} \cdots \mathbf{x}_k^{\alpha_k}$ , and let  $|\alpha|$  be the degree  $\alpha_1 + \alpha_2 + \cdots + \alpha_k$  of this monomial.
- Let S denote the ring of *symmetric* polynomials in P. These are the polynomials  $f \in P$  satisfying

$$f(x_1, x_2, \dots, x_k) = f(x_{\sigma(1)}, x_{\sigma(2)}, \dots, x_{\sigma(k)})$$

for all permutations  $\sigma$  of  $\{1, 2, \dots, k\}$ .

• Theorem (Artin  $\leq$ 1944): The S-module  $\mathcal P$  is free with basis

$$(x^{\alpha})_{\alpha \in \mathbb{N}^k; \ \alpha_i < i \text{ for each } i}$$
 (or, informally: " $(x_1^{<1} x_2^{<2} \cdots x_k^{< k})$ ").

**Example:** For k = 3, this basis is  $(1, x_3, x_3^2, x_2, x_2x_3, x_2x_3^2)$ .

## Symmetric polynomials

• The ring S of symmetric polynomials in  $\mathcal{P} = \mathbf{k} [x_1, x_2, \dots, x_k]$  has several bases, usually indexed by certain sets of (integer) partitions.

First, let us recall what partitions are:

 A partition means a weakly decreasing sequence of nonnegative integers that has only finitely many nonzero entries.

 A partition means a weakly decreasing sequence of nonnegative integers that has only finitely many nonzero entries.

```
Examples: (4,2,2,0,0,0,\ldots) and (3,2,0,0,0,0,\ldots) and (5,0,0,0,0,0,\ldots) are three partitions. (2,3,2,0,0,0,\ldots) and (2,1,1,1,\ldots) are not.
```

• A *k-partition* means a **weakly decreasing** *k*-tuple  $(\lambda_1, \lambda_2, \dots, \lambda_k) \in \mathbb{N}^k$ .

• A k-partition means a weakly decreasing k-tuple  $(\lambda_1, \lambda_2, \dots, \lambda_k) \in \mathbb{N}^k$ . **Examples:** (4, 2, 2) and (3, 2, 0) and (5, 0, 0) are three 3-partitions. (2, 3, 2) is not.

- A k-partition means a **weakly decreasing** k-tuple  $(\lambda_1, \lambda_2, \dots, \lambda_k) \in \mathbb{N}^k$ . **Examples:** (4, 2, 2) and (3, 2, 0) and (5, 0, 0) are three 3-partitions. (2, 3, 2) is not.
- Thus there is a bijection

$$\{k ext{-partitions}\} o \{ ext{partitions with at most } k ext{ nonzero entries} \},$$
 
$$\lambda \mapsto (\lambda_1, \lambda_2, \dots, \lambda_k, 0, 0, 0, \dots).$$

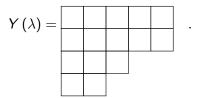

• A *k-partition* means a **weakly decreasing** *k*-tuple  $(\lambda_1, \lambda_2, \dots, \lambda_k) \in \mathbb{N}^k$ .

**Examples:** (4,2,2) and (3,2,0) and (5,0,0) are three 3-partitions.

(2,3,2) is not.

• If  $\lambda \in \mathbb{N}^k$  is a k-partition, then its *Young diagram*  $Y(\lambda)$  is defined as a table made out of k left-aligned rows, where the i-th row has  $\lambda_i$  boxes.

**Example:** If k = 6 and  $\lambda = (5, 5, 3, 2, 0, 0)$ , then

(Empty rows are invisible.)

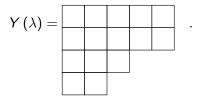

• A *k-partition* means a **weakly decreasing** *k*-tuple  $(\lambda_1, \lambda_2, \dots, \lambda_k) \in \mathbb{N}^k$ .

**Examples:** (4,2,2) and (3,2,0) and (5,0,0) are three 3-partitions.

(2,3,2) is not.

• If  $\lambda \in \mathbb{N}^k$  is a k-partition, then its Young diagram  $Y(\lambda)$  is defined as a table made out of k left-aligned rows, where the i-th row has  $\lambda_i$  boxes.

**Example:** If k = 6 and  $\lambda = (5, 5, 3, 2, 0, 0)$ , then

(Empty rows are invisible.)

The same convention applies to partitions.

• For each  $m \in \mathbb{Z}$ , we let  $e_m$  denote the m-th elementary symmetric polynomial:

$$e_{m} = \sum_{1 \leq i_{1} < i_{2} < \cdots < i_{m} \leq k} x_{i_{1}} x_{i_{2}} \cdots x_{i_{m}} = \sum_{\substack{\alpha \in \{0,1\}^{k}; \ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus, 
$$e_0 = 1$$
, and  $e_m = 0$  when  $m < 0$ .)

• For each  $m \in \mathbb{Z}$ , we let  $e_m$  denote the m-th elementary symmetric polynomial:

$$\underline{e_m} = \sum_{1 \leq i_1 < i_2 < \dots < i_m \leq k} x_{i_1} x_{i_2} \dots x_{i_m} = \sum_{\substack{\alpha \in \{0,1\}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $e_0 = 1$ , and  $e_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$${\color{red} \mathbf{e_{
u}}} = e_{
u_1} e_{
u_2} \cdots e_{
u_\ell} \in \mathcal{S}.$$

• For each  $m \in \mathbb{Z}$ , we let  $e_m$  denote the m-th elementary symmetric polynomial:

$$\underline{e_m} = \sum_{1 \leq i_1 < i_2 < \dots < i_m \leq k} x_{i_1} x_{i_2} \dots x_{i_m} = \sum_{\substack{\alpha \in \{0,1\}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $e_0 = 1$ , and  $e_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$$\mathbf{e}_{\mathbf{\nu}} = \mathbf{e}_{\nu_1} \mathbf{e}_{\nu_2} \cdots \mathbf{e}_{\nu_\ell} \in \mathcal{S}.$$

• Theorem (Gauss): The commutative **k**-algebra  $\mathcal{S}$  is freely generated by the elementary symmetric polynomials  $e_1, e_2, \ldots, e_k$ . (That is, it is generated by them, and they are algebraically independent.)

• For each  $m \in \mathbb{Z}$ , we let  $e_m$  denote the m-th elementary symmetric polynomial:

$$\underline{e_m} = \sum_{1 \leq i_1 < i_2 < \dots < i_m \leq k} x_{i_1} x_{i_2} \dots x_{i_m} = \sum_{\substack{\alpha \in \{0,1\}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $e_0 = 1$ , and  $e_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$$\mathbf{e}_{\nu} = e_{\nu_1} e_{\nu_2} \cdots e_{\nu_{\ell}} \in \mathcal{S}.$$

- Theorem (Gauss): The commutative **k**-algebra  $\mathcal{S}$  is freely generated by the elementary symmetric polynomials  $e_1, e_2, \ldots, e_k$ . (That is, it is generated by them, and they are algebraically independent.)
- Equivalent restatement:  $(e_{\lambda})_{\lambda \text{ is a partition whose entries are } \leq k$  is a basis of the **k**-module S.

• For each  $m \in \mathbb{Z}$ , we let  $e_m$  denote the m-th elementary symmetric polynomial:

$$\underline{e_m} = \sum_{1 \leq i_1 < i_2 < \dots < i_m \leq k} x_{i_1} x_{i_2} \dots x_{i_m} = \sum_{\substack{\alpha \in \{0,1\}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $e_0 = 1$ , and  $e_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$$\mathbf{e}_{\nu} = \mathbf{e}_{\nu_1} \mathbf{e}_{\nu_2} \cdots \mathbf{e}_{\nu_\ell} \in \mathcal{S}.$$

- Theorem (Gauss): The commutative **k**-algebra  $\mathcal{S}$  is freely generated by the elementary symmetric polynomials  $e_1, e_2, \ldots, e_k$ . (That is, it is generated by them, and they are algebraically independent.)
- Equivalent restatement:  $(e_{\lambda})_{\lambda \text{ is a partition whose entries are } \leq k$  is a basis of the **k**-module S.
- Note that  $e_m = 0$  when m > k.

• For each  $m \in \mathbb{Z}$ , we let  $h_m$  denote the m-th complete homogeneous symmetric polynomial:

$$h_{\mathbf{m}} = \sum_{1 \leq i_1 \leq i_2 \leq \dots \leq i_m \leq k} x_{i_1} x_{i_2} \cdots x_{i_m} = \sum_{\substack{\alpha \in \mathbb{N}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus, 
$$h_0 = 1$$
, and  $h_m = 0$  when  $m < 0$ .)

• For each  $m \in \mathbb{Z}$ , we let  $h_m$  denote the m-th complete homogeneous symmetric polynomial:

$$h_{\mathbf{m}} = \sum_{1 \leq i_1 \leq i_2 \leq \dots \leq i_m \leq k} x_{i_1} x_{i_2} \cdots x_{i_m} = \sum_{\substack{\alpha \in \mathbb{N}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $h_0 = 1$ , and  $h_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$$\mathbf{h}_{\nu} = \mathbf{h}_{\nu_1} \mathbf{h}_{\nu_2} \cdots \mathbf{h}_{\nu_{\ell}} \in \mathcal{S}.$$

• For each  $m \in \mathbb{Z}$ , we let  $h_m$  denote the m-th complete homogeneous symmetric polynomial:

$$h_{\mathbf{m}} = \sum_{1 \leq i_1 \leq i_2 \leq \dots \leq i_m \leq k} x_{i_1} x_{i_2} \cdots x_{i_m} = \sum_{\substack{\alpha \in \mathbb{N}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $h_0 = 1$ , and  $h_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$$h_{\nu} = h_{\nu_1} h_{\nu_2} \cdots h_{\nu_{\ell}} \in \mathcal{S}.$$

• **Theorem:** The commutative **k**-algebra S is freely generated by the complete homogeneous symmetric polynomials  $h_1, h_2, \ldots, h_k$ .

• For each  $m \in \mathbb{Z}$ , we let  $h_m$  denote the m-th complete homogeneous symmetric polynomial:

$$h_{\mathbf{m}} = \sum_{1 \leq i_1 \leq i_2 \leq \dots \leq i_m \leq k} x_{i_1} x_{i_2} \cdots x_{i_m} = \sum_{\substack{\alpha \in \mathbb{N}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $h_0 = 1$ , and  $h_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$$h_{\nu} = h_{\nu_1} h_{\nu_2} \cdots h_{\nu_{\ell}} \in \mathcal{S}.$$

- **Theorem:** The commutative **k**-algebra S is freely generated by the complete homogeneous symmetric polynomials  $h_1, h_2, \ldots, h_k$ .
- Equivalent restatement:  $(h_{\lambda})_{\lambda \text{ is a partition whose entries are } \leq k$  is a basis of the **k**-module S.

• For each  $m \in \mathbb{Z}$ , we let  $h_m$  denote the m-th complete homogeneous symmetric polynomial:

$$h_{\mathbf{m}} = \sum_{1 \leq i_1 \leq i_2 \leq \dots \leq i_m \leq k} x_{i_1} x_{i_2} \cdots x_{i_m} = \sum_{\substack{\alpha \in \mathbb{N}^k; \\ |\alpha| = m}} x^{\alpha} \in \mathcal{S}.$$

(Thus,  $h_0 = 1$ , and  $h_m = 0$  when m < 0.)

• For each  $\nu=(\nu_1,\nu_2,\ldots,\nu_\ell)\in\mathbb{Z}^\ell$  (e.g., a k-partition when  $\ell=k$ ), set

$$h_{\nu} = h_{\nu_1} h_{\nu_2} \cdots h_{\nu_{\ell}} \in \mathcal{S}.$$

- **Theorem:** The commutative **k**-algebra S is freely generated by the complete homogeneous symmetric polynomials  $h_1, h_2, \ldots, h_k$ .
- Equivalent restatement:  $(h_{\lambda})_{\lambda \text{ is a partition whose entries are } \leq k$  is a basis of the **k**-module S.
- Theorem:  $(h_{\lambda})_{\lambda \text{ is a } k\text{-partition}}$  is a basis of the **k**-module  $\mathcal{S}$ . (Another basis!)

# Symmetric polynomials: the *s*-basis (Schur polynomials)

• For each k-partition  $\lambda$ , we let  $s_{\lambda}$  be the  $\lambda$ -th Schur polynomial:

$$\begin{split} \mathbf{s}_{\pmb{\lambda}} &= \frac{\det\left(\left(x_i^{\lambda_j + k - j}\right)_{1 \leq i \leq k, \ 1 \leq j \leq k}\right)}{\det\left(\left(x_i^{k - j}\right)_{1 \leq i \leq k, \ 1 \leq j \leq k}\right)} & \text{(alternant formula)} \\ &= \det\left(\left(h_{\lambda_i - i + j}\right)_{1 \leq i \leq k, \ 1 \leq j \leq k}\right) & \text{(Jacobi-Trudi)} \,. \end{split}$$

# Symmetric polynomials: the s-basis (Schur polynomials)

• For each k-partition  $\lambda$ , we let  $s_{\lambda}$  be the  $\lambda$ -th Schur polynomial:

$$\begin{split} \mathbf{s}_{\pmb{\lambda}} &= \frac{\det \left( \left( x_i^{\lambda_j + k - j} \right)_{1 \leq i \leq k, \ 1 \leq j \leq k} \right)}{\det \left( \left( x_i^{k - j} \right)_{1 \leq i \leq k, \ 1 \leq j \leq k} \right)} & \text{(alternant formula)} \\ &= \det \left( (h_{\lambda_i - i + j})_{1 \leq i \leq k, \ 1 \leq j \leq k} \right) & \text{(Jacobi-Trudi)} \,. \end{split}$$

• **Theorem:** The equality above holds, and  $s_{\lambda}$  is a symmetric polynomial with nonnegative coefficients. Explicitly,

$$s_{\lambda} = \sum_{\substack{T \text{ is a semistandard } \lambda\text{-tableau} \\ \text{with entries } 1,2,\ldots,k}} \prod_{i=1}^{\kappa} x_i^{(\text{number of } i\text{'s in } T)},$$

where a *semistandard*  $\lambda$ -tableau with entries  $1, 2, \ldots, k$  is a way of putting an integer  $i \in \{1, 2, \ldots, k\}$  into each box of  $Y(\lambda)$  such that the entries **weakly** increase along rows and **strictly** increase along columns.

# Symmetric polynomials: the *s*-basis (Schur polynomials)

• For each k-partition  $\lambda$ , we let  $s_{\lambda}$  be the  $\lambda$ -th Schur polynomial:

$$\begin{split} \mathbf{s}_{\lambda} &= \frac{\det \left( \left( x_{i}^{\lambda_{j}+k-j} \right)_{1 \leq i \leq k, \ 1 \leq j \leq k} \right)}{\det \left( \left( x_{i}^{k-j} \right)_{1 \leq i \leq k, \ 1 \leq j \leq k} \right)} & \text{(alternant formula)} \\ &= \det \left( \left( h_{\lambda_{i}-i+j} \right)_{1 \leq i \leq k, \ 1 \leq j \leq k} \right) & \text{(Jacobi-Trudi)} \,. \end{split}$$

- **Theorem:** The equality above holds, and  $s_{\lambda}$  is a symmetric polynomial with nonnegative coefficients.
- **Theorem:**  $(s_{\lambda})_{\lambda \text{ is a } k\text{-partition}}$  is a basis of the **k**-module S.

# Symmetric polynomials: Littlewood-Richardson coefficients

• If  $\lambda$  and  $\mu$  are two k-partitions, then the product  $s_{\lambda}s_{\mu}$  can be again written as a **k**-linear combination of Schur polynomials (since these form a basis):

$$s_{\lambda}s_{\mu} = \sum_{
u ext{ is a $k$-partition}} c_{\lambda,\mu}^{
u} s_{
u},$$

where the  $c_{\lambda,\mu}^{\nu}$  lie in **k**. These  $c_{\lambda,\mu}^{\nu}$  are called the *Littlewood-Richardson coefficients*.

# Symmetric polynomials: Littlewood-Richardson coefficients

• If  $\lambda$  and  $\mu$  are two k-partitions, then the product  $s_{\lambda}s_{\mu}$  can be again written as a **k**-linear combination of Schur polynomials (since these form a basis):

$$s_{\lambda}s_{\mu} = \sum_{
u ext{ is a $k$-partition}} c_{\lambda,\mu}^{
u} s_{
u},$$

where the  $c_{\lambda,\mu}^{\nu}$  lie in **k**. These  $c_{\lambda,\mu}^{\nu}$  are called the *Littlewood-Richardson coefficients*.

• **Theorem:** These Littlewood-Richardson coefficients  $c_{\lambda,\mu}^{\nu}$  are nonnegative integers (and count something).

We have defined

$$s_{\lambda} = \det\left((h_{\lambda_i - i + j})_{1 \le i \le k, \ 1 \le j \le k}\right)$$

for k-partitions  $\lambda$ .

Apply the same definition to arbitrary  $\lambda \in \mathbb{Z}^k$ .

We have defined

$$s_{\lambda} = \det \left( (h_{\lambda_i - i + j})_{1 \le i \le k, \ 1 \le j \le k} \right)$$

for k-partitions  $\lambda$ .

Apply the same definition to arbitrary  $\lambda \in \mathbb{Z}^k$ .

• **Proposition:** If  $\alpha \in \mathbb{Z}^k$ , then  $s_\alpha$  is either 0 or equals  $\pm s_\lambda$  for some k-partition  $\lambda$ .

(So we get nothing really new.)

We have defined

$$s_{\lambda} = \det\left(\left(h_{\lambda_i - i + j}\right)_{1 \le i \le k, \ 1 \le j \le k}\right)$$

for k-partitions  $\lambda$ .

Apply the same definition to arbitrary  $\lambda \in \mathbb{Z}^k$ .

• **Proposition:** If  $\alpha \in \mathbb{Z}^k$ , then  $s_\alpha$  is either 0 or equals  $\pm s_\lambda$  for some k-partition  $\lambda$ .

More precisely: Let

$$\beta = (\alpha_1 + (k-1), \alpha_2 + (k-2), \dots, \alpha_k + (k-k)).$$

We have defined

$$s_{\lambda} = \det\left(\left(h_{\lambda_i - i + j}\right)_{1 \leq i \leq k, \ 1 \leq j \leq k}\right)$$

for k-partitions  $\lambda$ .

Apply the same definition to arbitrary  $\lambda \in \mathbb{Z}^k$ .

• **Proposition:** If  $\alpha \in \mathbb{Z}^k$ , then  $s_{\alpha}$  is either 0 or equals  $\pm s_{\lambda}$  for some k-partition  $\lambda$ .

More precisely: Let

$$\beta = (\alpha_1 + (k-1), \alpha_2 + (k-2), \dots, \alpha_k + (k-k)).$$

- If  $\beta$  has a negative entry, then  $s_{\alpha}=0$ .
- If  $\beta$  has two equal entries, then  $s_{\alpha}=0$ .
- Otherwise, let  $\gamma$  be the k-tuple obtained by sorting  $\beta$  in decreasing order, and let  $\sigma$  be the permutation of the indices that causes this sorting. Let  $\lambda$  be the k-partition  $(\gamma_1 (k-1), \gamma_2 (k-2), \dots, \gamma_k (k-k))$ . Then,  $s_{\alpha} = (-1)^{\sigma} s_{\lambda}$ .

We have defined

$$s_{\lambda} = \det\left(\left(h_{\lambda_i - i + j}\right)_{1 \leq i \leq k, \ 1 \leq j \leq k}\right)$$

for k-partitions  $\lambda$ .

Apply the same definition to arbitrary  $\lambda \in \mathbb{Z}^k$ .

• **Proposition:** If  $\alpha \in \mathbb{Z}^k$ , then  $s_{\alpha}$  is either 0 or equals  $\pm s_{\lambda}$  for some k-partition  $\lambda$ .

More precisely: Let

$$\beta = (\alpha_1 + (k-1), \alpha_2 + (k-2), \dots, \alpha_k + (k-k)).$$

- If  $\beta$  has a negative entry, then  $s_{\alpha} = 0$ .
- If  $\beta$  has two equal entries, then  $s_{\alpha} = 0$ .
- Otherwise, let  $\gamma$  be the k-tuple obtained by sorting  $\beta$  in decreasing order, and let  $\sigma$  be the permutation of the indices that causes this sorting. Let  $\lambda$  be the k-partition  $(\gamma_1 (k-1), \gamma_2 (k-2), \dots, \gamma_k (k-k))$ . Then,  $s_{\alpha} = (-1)^{\sigma} s_{\lambda}$ .
- Also, the alternant formula still holds if all  $\lambda_i + (k-i)$  are > 0.

• Pick any integer  $n \ge k$ .

- Pick any integer  $n \ge k$ .
- Let  $a_1, a_2, \ldots, a_k \in \mathcal{P}$  such that deg  $a_i < n k + i$  for all i. (For example, this holds if  $a_i \in \mathbf{k}$ .)

- Pick any integer  $n \ge k$ .
- Let  $a_1, a_2, \ldots, a_k \in \mathcal{P}$  such that deg  $a_i < n k + i$  for all i. (For example, this holds if  $a_i \in \mathbf{k}$ .)
- Let J be the ideal of P generated by the k differences

$$h_{n-k+1}-a_1, h_{n-k+2}-a_2, \ldots, h_n-a_k.$$

- Pick any integer  $n \ge k$ .
- Let  $a_1, a_2, \ldots, a_k \in \mathcal{P}$  such that deg  $a_i < n k + i$  for all i. (For example, this holds if  $a_i \in \mathbf{k}$ .)
- Let J be the ideal of P generated by the k differences

$$h_{n-k+1}-a_1, h_{n-k+2}-a_2, \ldots, h_n-a_k.$$

• **Theorem (G.):** The **k**-module P/J is free with basis

where the overline — means "projection" onto whatever quotient we need (here: from  $\mathcal{P}$  onto  $\mathcal{P}/J$ ). (This basis has  $n(n-1)\cdots(n-k+1)$  elements.)

# A slightly less general setting: symmetric $a_1, a_2, \ldots, a_k$ and J

• FROM NOW ON, assume that  $a_1, a_2, \ldots, a_k \in S$ .

# A slightly less general setting: symmetric $a_1, a_2, \ldots, a_k$ and J

- FROM NOW ON, assume that  $a_1, a_2, \ldots, a_k \in S$ .
- Let I be the ideal of S generated by the k differences

$$h_{n-k+1}-a_1, h_{n-k+2}-a_2, \ldots, h_n-a_k.$$

(Same differences as for J, but we are generating an ideal of  ${\cal S}$  now.)

# A slightly less general setting: symmetric $a_1, a_2, \ldots, a_k$ and J

- FROM NOW ON, assume that  $a_1, a_2, \ldots, a_k \in S$ .
- Let I be the ideal of S generated by the k differences

$$h_{n-k+1}-a_1, h_{n-k+2}-a_2, \ldots, h_n-a_k.$$

(Same differences as for J, but we are generating an ideal of  ${\cal S}$  now.)

• Let 
$$\omega = \underbrace{(n-k, n-k, \ldots, n-k)}_{k \text{ entries}}$$
 and

$$\begin{array}{l}
P_{k,n} = \{\lambda \text{ is a } k\text{-partition } \mid \lambda_1 \leq n - k\} \\
= \{k\text{-partitions } \lambda \subseteq \omega\}.
\end{array}$$

- Here, for two k-partitions  $\alpha$  and  $\beta$ , we say that  $\alpha \subseteq \beta$  if and only if  $\alpha_i \leq \beta_i$  for all i.
- Theorem (G.): The k-module S/I is free with basis

$$(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$$
.

# An even less general setting: constant $\overline{a_1, a_2, \dots, a_k}$

• FROM NOW ON, assume that  $a_1, a_2, \ldots, a_k \in \mathbf{k}$ .

### An even less general setting: constant $a_1, a_2, \ldots, a_k$

- FROM NOW ON, assume that  $a_1, a_2, \ldots, a_k \in k$ .
- This setting still is general enough to encompass ...
  - classical cohomology: If  $\mathbf{k} = \mathbb{Z}$  and  $a_1 = a_2 = \cdots = a_k = 0$ , then  $\mathcal{S} / I$  becomes the cohomology ring  $H^* \left( \operatorname{Gr} \left( k, n \right) \right)$ ; the basis  $\left( \overline{s_{\lambda}} \right)_{\lambda \in P_{k,n}}$  corresponds to the Schubert classes.
  - quantum cohomology: If  $\mathbf{k} = \mathbb{Z}[q]$  and  $a_1 = a_2 = \cdots = a_{k-1} = 0$  and  $a_k = -(-1)^k q$ , then  $\mathcal{S}/I$  becomes the quantum cohomology ring QH\* (Gr(k, n)).

### An even less general setting: constant $a_1, a_2, \ldots, a_k$

- FROM NOW ON, assume that  $a_1, a_2, \ldots, a_k \in \mathbf{k}$ .
- This setting still is general enough to encompass ...
  - classical cohomology: If  $\mathbf{k} = \mathbb{Z}$  and  $a_1 = a_2 = \cdots = a_k = 0$ , then  $\mathcal{S}/I$  becomes the cohomology ring  $H^*(Gr(k,n))$ ; the basis  $(\overline{s_\lambda})_{\lambda \in P_{k,n}}$  corresponds to the Schubert classes.
  - quantum cohomology: If  $\mathbf{k} = \mathbb{Z}[q]$  and  $a_1 = a_2 = \cdots = a_{k-1} = 0$  and  $a_k = -(-1)^k q$ , then  $\mathcal{S}/I$  becomes the quantum cohomology ring QH\* (Gr(k, n)).
- The above theorem lets us work in these rings (and more generally) without relying on geometry.

# $S_3$ -symmetry of the Gromov–Witten invariants

• Recall that  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  is a basis of the **k**-module  $\mathcal{S}/I$ .

• Recall that  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  is a basis of the **k**-module  $\mathcal{S}/I$ . For each  $\mu \in P_{k,n}$ , let  $\operatorname{coeff}_{\mu} : \mathcal{S}/I \to \mathbf{k}$  send each element to its  $\overline{s_{\mu}}$ -coordinate wrt this basis.

- Recall that  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  is a basis of the **k**-module  $\mathcal{S}/I$ . For each  $\mu \in P_{k,n}$ , let  $\operatorname{coeff}_{\mu} : \mathcal{S}/I \to \mathbf{k}$  send each element to its  $\overline{s_{\mu}}$ -coordinate wrt this basis.
- For every k-partition  $\nu = (\nu_1, \nu_2, \dots, \nu_k) \in P_{k,n}$ , we define

$$\nu^{\vee} := (n - k - \nu_k, n - k - \nu_{k-1}, \dots, n - k - \nu_1) \in P_{k,n}.$$

This *k*-partition  $\nu^{\vee}$  is called the *complement* of  $\nu$ .

- Recall that  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  is a basis of the **k**-module  $\mathcal{S}/I$ . For each  $\mu \in P_{k,n}$ , let  $\operatorname{coeff}_{\mu} : \mathcal{S}/I \to \mathbf{k}$  send each element to its  $\overline{s_{\mu}}$ -coordinate wrt this basis.
- For every k-partition  $\nu = (\nu_1, \nu_2, \dots, \nu_k) \in P_{k,n}$ , we define

$$\mathbf{v}^{\vee} := (n - k - \nu_k, n - k - \nu_{k-1}, \dots, n - k - \nu_1) \in P_{k,n}.$$

This *k*-partition  $\nu^{\vee}$  is called the *complement* of  $\nu$ .

• For any three k-partitions  $\alpha, \beta, \gamma \in P_{k,n}$ , let

$$\mathbf{g}_{\alpha,\beta,\gamma}:=\mathsf{coeff}_{\gamma^{\vee}}\left(\overline{s_{\alpha}s_{\beta}}\right)\in\mathbf{k}.$$

These generalize the Littlewood–Richardson coefficients and (3-point) Gromov–Witten invariants.

- Recall that  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  is a basis of the **k**-module  $\mathcal{S}/I$ . For each  $\mu \in P_{k,n}$ , let  $\operatorname{coeff}_{\mu} : \mathcal{S}/I \to \mathbf{k}$  send each element to its  $\overline{s_{\mu}}$ -coordinate wrt this basis.
- For every k-partition  $\nu = (\nu_1, \nu_2, \dots, \nu_k) \in P_{k,n}$ , we define

$$\mathbf{v}^{\vee} := (n - k - \nu_k, n - k - \nu_{k-1}, \dots, n - k - \nu_1) \in P_{k,n}.$$

This k-partition  $\nu^{\vee}$  is called the *complement* of  $\nu$ .

• For any three k-partitions  $\alpha, \beta, \gamma \in P_{k,n}$ , let

$$\mathbf{g}_{\alpha,\beta,\gamma} := \mathsf{coeff}_{\gamma^{\vee}} \left( \overline{s_{\alpha} s_{\beta}} \right) \in \mathbf{k}.$$

These generalize the Littlewood–Richardson coefficients and (3-point) Gromov–Witten invariants.

• Theorem (G.): For any  $\alpha, \beta, \gamma \in P_{k,n}$ , we have

$$egin{aligned} g_{lpha,eta,\gamma} &= g_{lpha,\gamma,eta} = g_{eta,lpha,\gamma} = g_{eta,\gamma,lpha} = g_{\gamma,lpha,eta} \ &= \mathsf{coeff}_{\omega}\left(\overline{s_{lpha}s_{eta}s_{\gamma}}
ight). \end{aligned}$$

- Recall that  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  is a basis of the **k**-module  $\mathcal{S}/I$ . For each  $\mu \in P_{k,n}$ , let  $\operatorname{coeff}_{\mu} : \mathcal{S}/I \to \mathbf{k}$  send each element to its  $\overline{s_{\mu}}$ -coordinate wrt this basis.
- For every k-partition  $\nu = (\nu_1, \nu_2, \dots, \nu_k) \in P_{k,n}$ , we define

$$\nu^{\vee} := (n - k - \nu_k, n - k - \nu_{k-1}, \dots, n - k - \nu_1) \in P_{k,n}.$$

This *k*-partition  $\nu^{\vee}$  is called the *complement* of  $\nu$ .

• For any three k-partitions  $\alpha, \beta, \gamma \in P_{k,n}$ , let

$$\mathbf{g}_{\alpha,\beta,\gamma}:=\mathsf{coeff}_{\gamma^{\vee}}\left(\overline{s_{\alpha}s_{\beta}}\right)\in\mathbf{k}.$$

These generalize the Littlewood–Richardson coefficients and (3-point) Gromov–Witten invariants.

• Theorem (G.): For any  $\alpha, \beta, \gamma \in P_{k,n}$ , we have

$$g_{\alpha,\beta,\gamma} = g_{\alpha,\gamma,\beta} = g_{\beta,\alpha,\gamma} = g_{\beta,\gamma,\alpha} = g_{\gamma,\alpha,\beta} = g_{\gamma,\beta,\alpha}$$
  
=  $\operatorname{coeff}_{\omega}\left(\overline{s_{\alpha}s_{\beta}s_{\gamma}}\right)$ .

• Equivalent restatement: Each  $\nu \in P_{k,n}$  and  $f \in \mathcal{S}/I$  satisfy  $\operatorname{coeff}_{\omega}(\overline{s_{\nu}}f) = \operatorname{coeff}_{\nu^{\vee}}(f)$ .

### The *h*-basis

• Theorem (G.): The k-module S/I is free with basis

$$(\overline{h_{\lambda}})_{\lambda \in P_{k,n}}$$
.

### The h-basis

• Theorem (G.): The k-module S/I is free with basis

$$(\overline{h_{\lambda}})_{\lambda \in P_{k,n}}$$
.

• The transfer matrix between the two bases  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  and  $(\overline{h_{\lambda}})_{\lambda \in P_{k,n}}$  is unitriangular wrt the "size-then-anti-dominance" order, but seems hard to describe.

#### The h-basis

• Theorem (G.): The k-module S/I is free with basis

$$(\overline{h_{\lambda}})_{\lambda \in P_{k,n}}$$
.

- The transfer matrix between the two bases  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  and  $(\overline{h_{\lambda}})_{\lambda \in P_{k,n}}$  is unitriangular wrt the "size-then-anti-dominance" order, but seems hard to describe.
- **Proposition (G.):** Let *m* be a positive integer. Then,

$$\overline{h_{n+m}} = \sum_{j=0}^{k-1} (-1)^j a_{k-j} \overline{s_{(m,1^j)}},$$

where  $(m, 1^j) := (m, \underbrace{1, 1, \dots, 1}_{j \text{ ones}}, 0, 0, 0, \dots)$  (a hook-shaped k-partition).

• If  $\alpha$  and  $\beta$  are two k-partitions, then we say that  $\alpha/\beta$  is a horizontal strip if and only if the Young diagram  $Y(\alpha)$  is obtained from  $Y(\beta)$  by adding some (possibly none) extra boxes with no two of these new boxes lying in the same column.

**Example:** If k = 4 and  $\alpha = (5, 3, 2, 1)$  and  $\beta = (3, 2, 2, 0)$ , then  $\alpha/\beta$  is a horizontal strip, since

with no two X's in the same column.

- If  $\alpha$  and  $\beta$  are two k-partitions, then we say that  $\alpha/\beta$  is a horizontal strip if and only if the Young diagram  $Y(\alpha)$  is obtained from  $Y(\beta)$  by adding some (possibly none) extra boxes with no two of these new boxes lying in the same column.
- Equivalently,  $\alpha/\beta$  is a horizontal strip if and only if

$$\alpha_1 \ge \beta_1 \ge \alpha_2 \ge \beta_2 \ge \alpha_3 \ge \cdots \ge \alpha_k \ge \beta_k$$
.

- If  $\alpha$  and  $\beta$  are two k-partitions, then we say that  $\alpha/\beta$  is a horizontal strip if and only if the Young diagram  $Y(\alpha)$  is obtained from  $Y(\beta)$  by adding some (possibly none) extra boxes with no two of these new boxes lying in the same column.
- ullet Equivalently, lpha/eta is a horizontal strip if and only if

$$\alpha_1 \ge \beta_1 \ge \alpha_2 \ge \beta_2 \ge \alpha_3 \ge \cdots \ge \alpha_k \ge \beta_k$$
.

• Furthermore, given  $j \in \mathbb{N}$ , we say that  $\alpha/\beta$  is a horizontal j-strip if  $\alpha/\beta$  is a horizontal strip and  $|\alpha| - |\beta| = j$ .

- If  $\alpha$  and  $\beta$  are two k-partitions, then we say that  $\alpha/\beta$  is a horizontal strip if and only if the Young diagram  $Y(\alpha)$  is obtained from  $Y(\beta)$  by adding some (possibly none) extra boxes with no two of these new boxes lying in the same column.
- ullet Equivalently, lpha/eta is a horizontal strip if and only if

$$\alpha_1 \ge \beta_1 \ge \alpha_2 \ge \beta_2 \ge \alpha_3 \ge \cdots \ge \alpha_k \ge \beta_k$$
.

- Furthermore, given  $j \in \mathbb{N}$ , we say that  $\alpha/\beta$  is a horizontal j-strip if  $\alpha/\beta$  is a horizontal strip and  $|\alpha| |\beta| = j$ .
- Theorem (Pieri). Let  $\lambda$  be a k-partition. Let  $j \in \mathbb{N}$ . Then,

$$s_{\lambda}h_{j} = \sum_{\substack{\mu ext{ is a } k ext{-partition};\ \mu 
eq \lambda ext{ is a horizontal } j ext{-strip}}} s_{\mu}.$$

### A Pieri rule for S/I

• Theorem (G.): Let  $\lambda \in P_{k,n}$ . Let  $j \in \{0, 1, \dots, n-k\}$ . Then,

$$\overline{s_{\lambda}h_{j}} = \sum_{\substack{\mu \in P_{k,n};\\ \mu / \lambda \text{ is a}\\ \text{horizontal } i\text{-strip}}} \overline{s_{\mu}} - \sum_{i=1}^{k} \left(-1\right)^{i} a_{i} \sum_{\nu \subseteq \lambda} c_{(n-k-j+1,1^{i-1}),\nu}^{\lambda} \overline{s_{\nu}}.$$

### A Pieri rule for S/I

• Theorem (G.): Let  $\lambda \in P_{k,n}$ . Let  $j \in \{0, 1, \dots, n-k\}$ . Then,

$$\overline{s_{\lambda}h_{j}} = \sum_{\substack{\mu \in P_{k,n};\\ \mu \diagup \lambda \text{ is a}\\ \text{horizontal } j\text{-strip}}} \overline{s_{\mu}} - \sum_{i=1}^{k} \left(-1\right)^{i} a_{i} \sum_{\nu \subseteq \lambda} c_{(n-k-j+1,1^{i-1}),\nu}^{\lambda} \overline{s_{\nu}}.$$

• This generalizes the h-Pieri rule from Bertram, Ciocan-Fontanine and Fulton, but note that  $c^{\lambda}_{(n-k-j+1,1^{i-1}),\nu}$  may be >1.

### A Pieri rule for S/I: example

• **Example:** For n = 7 and k = 3, we have

$$\overline{s_{(4,3,2)}h_2} = \overline{s_{(4,4,3)}} + a_1 \left( \overline{s_{(4,2)}} + \overline{s_{(3,2,1)}} + \overline{s_{(3,3)}} \right) 
- a_2 \left( \overline{s_{(4,1)}} + \overline{s_{(2,2,1)}} + \overline{s_{(3,1,1)}} + 2\overline{s_{(3,2)}} \right) 
+ a_3 \left( \overline{s_{(2,2)}} + \overline{s_{(2,1,1)}} + \overline{s_{(3,1)}} \right).$$

### A Pieri rule for S/I: example

• **Example:** For n = 7 and k = 3, we have

$$\overline{s_{(4,3,2)}h_2} = \overline{s_{(4,4,3)}} + a_1 \left( \overline{s_{(4,2)}} + \overline{s_{(3,2,1)}} + \overline{s_{(3,3)}} \right) \\
- a_2 \left( \overline{s_{(4,1)}} + \overline{s_{(2,2,1)}} + \overline{s_{(3,1,1)}} + 2\overline{s_{(3,2)}} \right) \\
+ a_3 \left( \overline{s_{(2,2)}} + \overline{s_{(2,1,1)}} + \overline{s_{(3,1)}} \right).$$

• Multiplying by  $e_j$  appears harder: For n = 5 and k = 3, we have

$$\overline{s_{(2,2,1)}e_2}=a_1\overline{s_{(2,2)}}-2a_2\overline{s_{(2,1)}}+a_3\left(\overline{s_{(2)}}+\overline{s_{(1,1)}}\right)+a_1^2\overline{s_{(1)}}-2a_1a_2\overline{s_{()}}.$$

## A Pieri rule for S/I: example

• **Example:** For n = 7 and k = 3, we have

$$\overline{s_{(4,3,2)}h_2} = \overline{s_{(4,4,3)}} + a_1 \left( \overline{s_{(4,2)}} + \overline{s_{(3,2,1)}} + \overline{s_{(3,3)}} \right) 
- a_2 \left( \overline{s_{(4,1)}} + \overline{s_{(2,2,1)}} + \overline{s_{(3,1,1)}} + 2\overline{s_{(3,2)}} \right) 
+ a_3 \left( \overline{s_{(2,2)}} + \overline{s_{(2,1,1)}} + \overline{s_{(3,1)}} \right).$$

• Multiplying by  $e_j$  appears harder: For n = 5 and k = 3, we have

$$\overline{s_{(2,2,1)}e_3} = -a_1\overline{s_{(2,2)}} + a_2\overline{s_{(2,1)}} + a_0^2\overline{s_{(2)}} - 2a_0a_1\overline{s_{(1)}} + a_1^2\overline{s_{(1)}}.$$

So, even multiplying by  $e_k$  can give a mess...

• For QH\* (Gr (k,n)), Bertram, Ciocan-Fontanine and Fulton give a "rim hook algorithm" that rewrites an arbitrary  $\overline{s_{\mu}}$  as  $(-1)^{\text{something}} q^{\text{something}} \overline{s_{\overline{\lambda}}}$  with  $\lambda \in P_{k,n}$ . Is there such a thing for  $S \nearrow I$ ?

• For QH\* (Gr (k,n)), Bertram, Ciocan-Fontanine and Fulton give a "rim hook algorithm" that rewrites an arbitrary  $\overline{s_{\mu}}$  as  $(-1)^{\text{something}} q^{\text{something}} \overline{s_{\lambda}}$  with  $\lambda \in P_{k,n}$ . Is there such a thing for  $\mathcal{S}/I$ ? If n=6 and k=3, then

$$\overline{s_{(4,4,3)}} = a_2^2 \overline{s_{(1)}} - 2a_1 a_2 \overline{s_{(2)}} + a_1^2 \overline{s_{(3)}} + a_3 \overline{s_{(3,2)}} - a_2 \overline{s_{(3,3)}}.$$

Looks hopeless...

• For QH\* (Gr (k,n)), Bertram, Ciocan-Fontanine and Fulton give a "rim hook algorithm" that rewrites an arbitrary  $\overline{s_{\mu}}$  as  $(-1)^{\text{something}} q^{\text{something}} \overline{s_{\overline{\lambda}}}$  with  $\lambda \in P_{k,n}$ . Is there such a thing for  $\mathcal{S}/I$ ? If n=6 and k=3, then

$$\overline{s_{(4,4,3)}} = a_2^2 \overline{s_{(1)}} - 2a_1 a_2 \overline{s_{(2)}} + a_1^2 \overline{s_{(3)}} + a_3 \overline{s_{(3,2)}} - a_2 \overline{s_{(3,3)}}.$$

• Theorem (G.): Let  $\mu$  be a k-partition with  $\mu_1 > n - k$ . Let

$$W = \left\{ \lambda = (\lambda_1, \lambda_2, \dots, \lambda_k) \in \mathbb{Z}^k \mid \lambda_1 = \mu_1 - n \right.$$
  
and  $\lambda_i - \mu_i \in \{0, 1\}$  for all  $i \in \{2, 3, \dots, k\}\}$ .

(Not all elements of W are k-partitions, but all belong to  $\mathbb{Z}^k$ , so we know how to define  $s_{\lambda}$  for them.)

• For QH\* (Gr (k,n)), Bertram, Ciocan-Fontanine and Fulton give a "rim hook algorithm" that rewrites an arbitrary  $\overline{s_{\mu}}$  as  $(-1)^{\text{something}}\,q^{\text{something}}\overline{s_{\lambda}}$  with  $\lambda \in P_{k,n}$ . Is there such a thing for  $\mathcal{S}/I$ ? If n=6 and k=3, then

$$\overline{s_{(4,4,3)}} = a_2^2 \overline{s_{(1)}} - 2a_1 a_2 \overline{s_{(2)}} + a_1^2 \overline{s_{(3)}} + a_3 \overline{s_{(3,2)}} - a_2 \overline{s_{(3,3)}}.$$

• Theorem (G.): Let  $\mu$  be a k-partition with  $\mu_1 > n - k$ . Let

$$W = \left\{ \lambda = (\lambda_1, \lambda_2, \dots, \lambda_k) \in \mathbb{Z}^k \mid \lambda_1 = \mu_1 - n \right.$$
  
and  $\lambda_i - \mu_i \in \{0, 1\}$  for all  $i \in \{2, 3, \dots, k\} \}$ .

Then,

$$\overline{s_{\mu}} = \sum_{j=1}^{k} (-1)^{k-j} a_{j} \sum_{\substack{\lambda \in W; \\ |\lambda| = |\mu| - (n-k+j)}} \overline{s_{\lambda}}$$

# Positivity?

- Conjecture: Let  $b_i = (-1)^{n-k-1} a_i$  for each  $i \in \{1, 2, \ldots, k\}$ . Let  $\lambda, \mu, \nu \in P_{k,n}$ . Then,  $(-1)^{|\lambda|+|\mu|-|\nu|} \operatorname{coeff}_{\nu}(\overline{s_{\lambda}s_{\mu}})$  is a polynomial in  $b_1, b_2, \ldots, b_k$  with coefficients in  $\mathbb{N}$ .
- Verified for all  $n \le 8$  using SageMath.
- This would generalize positivity of Gromov-Witten invariants.

#### Other bases?

• Theorem (G.): The k-module S/I is free with basis

$$(\overline{m_{\lambda}})_{\lambda \in P_{k,n}}$$
,

where

$$m_\lambda=\left( ext{the sum of all distinct permutations of}
ight.$$
 the monomial  $x_1^{\lambda_1}x_2^{\lambda_2}\cdots x_k^{\lambda_k}
ight)$ 

is a monomial symmetric polynomial.

# $S_k$ -module structure

- The symmetric group  $S_k$  acts on  $\mathcal{P}$ , with invariant ring  $\mathcal{S}$ .
- What is the  $S_k$ -module structure on  $\mathcal{P}/J$ ?

## $S_k$ -module structure

- The symmetric group  $S_k$  acts on  $\mathcal{P}$ , with invariant ring  $\mathcal{S}$ .
- What is the  $S_k$ -module structure on  $\mathcal{P}/J$ ?
- Almost-theorem (G., needs to be checked): Assume that  $\mathbf{k}$  is a  $\mathbb{Q}$ -algebra. Then, as  $S_k$ -modules,

$$\mathcal{P}/J \cong (\mathcal{P}/\mathcal{PS}^+)^{\times \binom{n}{k}} \cong \left(\underbrace{\mathbf{k}S_k}_{\text{regular rep}}\right)^{\times \binom{n}{k}},$$

where  $\mathcal{PS}^+$  is the ideal of  $\mathcal{P}$  generated by symmetric polynomials with constant term 0.

 Let us recall symmetric functions (not polynomials) now; we'll need them soon anyway.

```
\begin{split} \mathcal{S} &:= \{ \text{symmetric polynomials in } x_1, x_2, \dots, x_k \} \, ; \\ & \Lambda := \{ \text{symmetric functions in } x_1, x_2, x_3, \dots \} \, . \end{split}
```

Let us recall symmetric functions (not polynomials) now;
 we'll need them soon anyway.

```
\begin{split} \mathcal{S} &:= \{ \text{symmetric polynomials in } x_1, x_2, \dots, x_k \} \, ; \\ & \bigwedge := \{ \text{symmetric functions in } x_1, x_2, x_3, \dots \} \, . \end{split}
```

 We use standard notations for symmetric functions, but in boldface:

```
    e = elementary symmetric,
    h = complete homogeneous,
    s = Schur (or skew Schur).
```

 Let us recall symmetric functions (not polynomials) now; we'll need them soon anyway.

$$\mathcal{S} := \{ \text{symmetric polynomials in } x_1, x_2, \dots, x_k \} ; \\ \mathbf{\Lambda} := \{ \text{symmetric functions in } x_1, x_2, x_3, \dots \} .$$

 We use standard notations for symmetric functions, but in boldface:

$$\mathbf{e} = \text{elementary symmetric},$$
  
 $\mathbf{h} = \text{complete homogeneous},$   
 $\mathbf{s} = \text{Schur (or skew Schur)}.$ 

We have

$$\begin{split} \mathcal{S} &\cong \Lambda \diagup \left( \mathbf{e}_{k+1}, \ \mathbf{e}_{k+2}, \ \mathbf{e}_{k+3}, \ \ldots \right)_{ideal}, \quad \text{thus} \\ \mathcal{S} \diagup I &\cong \Lambda \diagup \left( \mathbf{h}_{n-k+1} - a_1, \ \mathbf{h}_{n-k+2} - a_2, \ \ldots, \ \mathbf{h}_n - a_k, \\ \mathbf{e}_{k+1}, \ \mathbf{e}_{k+2}, \ \mathbf{e}_{k+3}, \ \ldots \right)_{ideal}. \end{split}$$

Let us recall symmetric functions (not polynomials) now;
 we'll need them soon anyway.

 We use standard notations for symmetric functions, but in boldface:

$$\mathbf{e} = \text{elementary symmetric},$$
  
 $\mathbf{h} = \text{complete homogeneous},$   
 $\mathbf{s} = \text{Schur (or skew Schur)}.$ 

We have

$$\begin{split} \mathcal{S} &\cong \text{$\Lambda$/$} \left(\mathbf{e}_{k+1}, \ \mathbf{e}_{k+2}, \ \mathbf{e}_{k+3}, \ \ldots\right)_{\text{ideal}}, \quad \text{thus} \\ \mathcal{S} \middle/ I &\cong \text{$\Lambda$/$} \left(\mathbf{h}_{n-k+1} - a_1, \ \mathbf{h}_{n-k+2} - a_2, \ \ldots, \ \mathbf{h}_n - a_k, \right. \\ & \mathbf{e}_{k+1}, \ \mathbf{e}_{k+2}, \ \mathbf{e}_{k+3}, \ \ldots\right)_{\text{ideal}}. \end{split}$$

• So why not replace the  $e_j$  by  $e_j - b_j$  too?

• Theorem (G.): Assume that  $\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_k$  as well as  $\mathbf{b}_1, \mathbf{b}_2, \mathbf{b}_3, \dots$  are elements of  $\Lambda$  such that

$$\deg \mathbf{a}_i < n - k + i$$
 and  $\deg \mathbf{b}_i < k + i$ .

Then,

$$\begin{split} & \text{$\Lambda$/ (\textbf{h}_{n-k+1} - \textbf{a}_1, \ \textbf{h}_{n-k+2} - \textbf{a}_2, \ \dots, \ \textbf{h}_n - \textbf{a}_k, $} \\ & & \textbf{e}_{k+1} - \textbf{b}_1, \ \textbf{e}_{k+2} - \textbf{b}_2, \ \textbf{e}_{k+3} - \textbf{b}_3, \ \dots)_{\text{ideal}} \end{split}$$

is a free **k**-module with basis  $(\overline{\mathbf{s}_{\lambda}})_{\lambda \in P_{k,n}}$ .

- **Example:** Let k = 3, and rename  $x_1, x_2, x_3$  as x, y, z. Use the degree-lexicographic order. Let  $\mathcal{I}$  be the ideal generated by  $x^2 yz, y^2 zx, z^2 xy$ . Then:
  - The triple  $(x^2-yz,y^2-zx,z^2-xy)$  is not a Gröbner basis of  $\mathcal{I}$ , since its leading monomials are  $x^2,xz,xy$ , but the leading term  $y^3$  of the polynomial  $y^3-z^3\in\mathcal{I}$  is not divisible by any of them.
  - The quadruple  $(y^3 z^3, x^2 yz, xy z^2, xz y^2)$  is a Gröbner basis of  $\mathcal{I}$ . (Thanks SageMath, and whatever packages it uses for this.)

### Gröbner bases, 3: Buchberger's first criterion

 Note: Our definition of Gröbner basis is a straightforward generalization of the usual one, since k may not be a field.
 Note that some texts use different generalizations!

### Gröbner bases, 3: Buchberger's first criterion

- Note: Our definition of Gröbner basis is a straightforward generalization of the usual one, since k may not be a field.
   Note that some texts use different generalizations!
- Theorem (Buchberger's first criterion). Let  $\mathcal I$  be an ideal of  $\mathcal P$ .

Let  $(f_i)_{i \in G}$  be a family of quasi-monic polynomials that generates  $\mathcal{I}$ .

Assume that the leading monomials of all the  $f_i$  are mutually coprime (i.e., each indeterminate appears in the leading monomial of  $f_i$  for at most one  $i \in G$ ).

Then,  $(f_i)_{i \in G}$  is a Gröbner basis of  $\mathcal{I}$ .

#### Gröbner bases, 3: Buchberger's first criterion

- Note: Our definition of Gröbner basis is a straightforward generalization of the usual one, since k may not be a field.
   Note that some texts use different generalizations!
- Theorem (Buchberger's first criterion). Let  $\mathcal I$  be an ideal of  $\mathcal P$ .

Let  $(f_i)_{i \in G}$  be a family of quasi-monic polynomials that generates  $\mathcal{I}$ .

Assume that the leading monomials of all the  $f_i$  are mutually coprime (i.e., each indeterminate appears in the leading monomial of  $f_i$  for at most one  $i \in G$ ).

Then,  $(f_i)_{i \in G}$  is a Gröbner basis of  $\mathcal{I}$ .

• **Example:** Let k=3, and rename  $x_1, x_2, x_3$  as x, y, z. Use the degree-lexicographic order. Let  $\mathcal{I}$  be the ideal generated by  $x^3-yz, y^3-zx, z^3-xy$ . Then,  $\left(x^3-yz, y^3-zx, z^3-xy\right)$  is a Gröbner basis of  $\mathcal{I}$ , since its leading monomials  $x^3, y^3, z^3$  are mutually coprime.

#### Gröbner bases, 4: Macaulay's basis theorem

• Theorem (Macaulay's basis theorem). Let  $\mathcal{I}$  be an ideal of  $\mathcal{P}$  that has a Gröbner basis  $(f_i)_{i \in G}$ . A monomial  $\mathfrak{m}$  will be called *reduced* if it is not divisible by the leading term of any  $f_i$ . Then, the projections of the reduced monomials form a basis of the  $\mathbf{k}$ -module  $\mathcal{P}/\mathcal{I}$ .

#### Gröbner bases, 4: Macaulay's basis theorem

- Theorem (Macaulay's basis theorem). Let  $\mathcal{I}$  be an ideal of  $\mathcal{P}$  that has a Gröbner basis  $(f_i)_{i \in G}$ . A monomial  $\mathfrak{m}$  will be called *reduced* if it is not divisible by the leading term of any  $f_i$ . Then, the projections of the reduced monomials form a basis of the  $\mathbf{k}$ -module  $\mathcal{P}/\mathcal{I}$ .
- Example: Let k=3, and rename  $x_1,x_2,x_3$  as x,y,z. Use the degree-lexicographic order. Let  $\mathcal I$  be the ideal generated by  $x^3-yz,y^3-zx,z^3-xy$ . Then,  $\left(x^3-yz,y^3-zx,z^3-xy\right)$  is a Gröbner basis of  $\mathcal I$ . Thus,  $\left(\overline{x^iy^jz^\ell}\right)_{i,i,\ell<3}$  is a basis of  $\mathcal P/\mathcal I$ .

#### Gröbner bases, 4: Macaulay's basis theorem

- Theorem (Macaulay's basis theorem). Let  $\mathcal{I}$  be an ideal of  $\mathcal{P}$  that has a Gröbner basis  $(f_i)_{i \in G}$ . A monomial  $\mathfrak{m}$  will be called *reduced* if it is not divisible by the leading term of any  $f_i$ . Then, the projections of the reduced monomials form a basis of the  $\mathbf{k}$ -module  $\mathcal{P}/\mathcal{I}$ .
- **Example:** Let k=3, and rename  $x_1, x_2, x_3$  as x, y, z. Use the degree-lexicographic order. Let  $\mathcal{I}$  be the ideal generated by  $x^3-yz, y^3-zx, z^3-xy$ . Then,  $\left(x^3-yz, y^3-zx, z^3-xy\right)$  is a Gröbner basis of  $\mathcal{I}$ . Thus,  $\left(\overline{x^iy^jz^\ell}\right)_{i,i,\ell\leq 3}$  is a basis of  $\mathcal{P}/\mathcal{I}$ .
- Example: Let k=3, and rename  $x_1,x_2,x_3$  as x,y,z. Use the degree-lexicographic order. Let  $\mathcal I$  be the ideal generated by  $x^2-yz,y^2-zx,z^2-xy$ . Then,  $\left(y^3-z^3,x^2-yz,xy-z^2,xz-y^2\right)$  is a Gröbner basis of  $\mathcal I$ . Thus,  $(\overline x)\cup\left(\overline{y^jz^\ell}\right)_{j<3}$  is a basis of  $\mathcal P/\mathcal I$ .

### On the proofs, 2: the Gröbner basis argument

It is easy to prove the identity

$$h_p(x_{i..k}) = \sum_{t=0}^{i-1} (-1)^t e_t(x_{1..i-1}) h_{p-t}(x_{1..k})$$

for all  $i \in \{1, 2, \dots, k+1\}$  and  $p \in \mathbb{N}$ .

Here,  $x_{a..b}$  means  $x_a, x_{a+1}, \ldots, x_b$ .

Use this to show that

$$\left(h_{n-k+i}(x_{i..k}) - \sum_{t=0}^{i-1} (-1)^t e_t(x_{1..i-1}) a_{i-t}\right)_{i \in \{1,2,...,k\}}$$

is a Gröbner basis of the ideal J wrt the degree-lexicographic order.

• Thus, Macaulay's basis theorem shows that  $(\overline{x^{\alpha}})_{\alpha \in \mathbb{N}^k: \alpha: < n-k+i \text{ for each } i}$  is a basis of the **k**-module  $\mathcal{P}/J$ .

• How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  ?

- How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.

- How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.

$$\Longrightarrow (\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$$
 spans  $\mathcal{S}/I$ .

- How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$ ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.
  - $\Longrightarrow (\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  spans  $\mathcal{S}/I$ .
- On the other hand,  $(x^{\alpha})_{\alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i}$  spans  $\mathcal{P}$  as an  $\mathcal{S}$ -module (Artin).

- How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$ ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.
  - $\Longrightarrow (\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  spans  $\mathcal{S}/I$ .
- On the other hand,  $(x^{\alpha})_{\alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i}$  spans  $\mathcal{P}$  as an  $\mathcal{S}$ -module (Artin).
- Combining these yields that  $(\overline{s_{\lambda}x^{\alpha}})_{\lambda \in P_{k,n}; \alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i \text{ spans } \mathcal{P}/I\mathcal{P} = \mathcal{P}/J.$

- How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$ ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.
  - $\Longrightarrow (\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  spans  $\mathcal{S}/I$ .
- On the other hand,  $(x^{\alpha})_{\alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i}$  spans  $\mathcal{P}$  as an  $\mathcal{S}$ -module (Artin).
- Combining these yields that  $(\overline{s_{\lambda}x^{\alpha}})_{\lambda \in P_{k,n}; \alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i \text{ spans } \mathcal{P}/I\mathcal{P} = \mathcal{P}/J.$
- But we also know that the family  $(\overline{x^{\alpha}})_{\alpha \in \mathbb{N}^k; \alpha_i < n-k+i \text{ for each } i}$  is a basis of  $\mathcal{P}/J$ .

- How to prove that S/I is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$ ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.
  - $\Longrightarrow (\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  spans  $\mathcal{S}/I$ .
- On the other hand,  $(x^{\alpha})_{\alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i}$  spans  $\mathcal{P}$  as an  $\mathcal{S}$ -module (Artin).
- Combining these yields that  $(\overline{s_{\lambda}x^{\alpha}})_{\lambda \in P_{k,n}; \ \alpha \in \mathbb{N}^k; \ \alpha_i < i \text{ for each } i \text{ spans } \mathcal{P}/I\mathcal{P} = \mathcal{P}/J.$
- But we also know that the family  $(\overline{x^{\alpha}})_{\alpha \in \mathbb{N}^k; \alpha_i < n-k+i \text{ for each } i}$  is a basis of  $\mathcal{P}/J$ .
- What can you say if a **k**-module has a basis  $(a_v)_{v \in V}$  and a spanning family  $(b_u)_{u \in U}$  of the same finite size  $(|U| = |V| < \infty)$ ?

- How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$ ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.  $\Longrightarrow (\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  spans  $\mathcal{S}/I$ .
- On the other hand,  $(x^{\alpha})_{\alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i}$  spans  $\mathcal{P}$  as an  $\mathcal{S}$ -module (Artin).
- Combining these yields that  $(\overline{s_{\lambda}x^{\alpha}})_{\lambda \in P_{k,n}; \alpha \in \mathbb{N}^k; \alpha_i < i}$  for each i spans  $\mathcal{P}/I\mathcal{P} = \mathcal{P}/J$ .
- But we also know that the family  $(\overline{x^{\alpha}})_{\alpha \in \mathbb{N}^k; \alpha_i < n-k+i \text{ for each } i}$  is a basis of  $\mathcal{P}/J$ .
- What can you say if a **k**-module has a basis  $(a_v)_{v \in V}$  and a spanning family  $(b_u)_{u \in U}$  of the same finite size  $(|U| = |V| < \infty)$ ?

  Easy exercise: You can say that  $(b_u)_{u \in U}$  is also a basis.

- How to prove that  $\mathcal{S}/I$  is free with basis  $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$ ?
- Jacobi–Trudi lets you recursively reduce each  $\overline{s_{\lambda}}$  with  $\lambda \notin P_{k,n}$  into smaller  $\overline{s_{\mu}}$ 's.
  - $\Longrightarrow (\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  spans  $\mathcal{S}/I$ .
- On the other hand,  $(x^{\alpha})_{\alpha \in \mathbb{N}^k; \alpha_i < i \text{ for each } i}$  spans  $\mathcal{P}$  as an  $\mathcal{S}$ -module (Artin).
- Combining these yields that  $(\overline{s_{\lambda}x^{\alpha}})_{\lambda \in P_{k,n}; \ \alpha \in \mathbb{N}^k; \ \alpha_i < i \text{ for each } i \text{ spans } \mathcal{P}/I\mathcal{P} = \mathcal{P}/J.$
- But we also know that the family  $(\overline{x^{\alpha}})_{\alpha \in \mathbb{N}^k; \alpha_i < n-k+i \text{ for each } i}$  is a basis of  $\mathcal{P}/J$ .

- ullet  $\Longrightarrow$   $(\overline{s_{\lambda}})_{\lambda \in P_{k,n}}$  is a basis of  $\mathcal{S}/I$ .

## On the proofs, 4: Bernstein's identity

• The rest of the proofs are long computations inside  $\Lambda$ , using various identities for symmetric functions.

### On the proofs, 4: Bernstein's identity

- The rest of the proofs are long computations inside  $\Lambda$ , using various identities for symmetric functions.
- Maybe the most important one: **Bernstein's identity:** Let  $\lambda$  be a partition. Let  $m \in \mathbb{Z}$  be such that  $m \geq \lambda_1$ . Then,

$$\sum_{i\in\mathbb{N}}\left(-1\right)^{i}\mathbf{h}_{m+i}\left(\mathbf{e}_{i}\right)^{\perp}\mathbf{s}_{\lambda}=\mathbf{s}_{\left(m,\lambda_{1},\lambda_{2},\lambda_{3},\ldots\right)}.$$

Here,  $\mathbf{f}^{\perp}\mathbf{g}$  means " $\mathbf{g}$  skewed by  $\mathbf{f}$ " (so that  $(\mathbf{s}_{\mu})^{\perp}\mathbf{s}_{\lambda} = \mathbf{s}_{\lambda/\mu}$ ).

#### Thank you

- Sasha Postnikov for the paper that gave rise to this project in 2013.
- **Gérard Duchamp** for the invitation.
- Dongkwan Kim, Victor Reiner, Tom Roby, Travis
   Scrimshaw, Mark Shimozono, Josh Swanson, Kaisa
   Taipale, and Anders Thorup for enlightening discussions.
- you for your patience.
